Using a mm graph paper is first step to draft skeleton plots. The decades are labeled on the x-axis and a vertical line is drawn on a y-scale composed of 10 units. Any ring that is smaller than its neighbor rings (± 3 on either side) gets a line drawn on the paper. If the ring is very small, the line may be 10 units. If the ring is half as small as its predecessor you might code it as a 5, etc. (rings that are coded less than a 5 are rarely useful in crossdating). This is a bit counterintuitive because the longer the line, the smaller the ring. According to the provided skeleton graphs, cross-dating among different samples comparing with control sample would be possible. It is also possible to recognize different years of various samples from different sources for cross-dating.

A more precise method of dating volcanic deposits of recent age is to identify anomalous growth patterns among the annual rings of trees growing at the time the deposits were emplaced. Trees that were injured but not killed by tephra or lahars may show a sequence of narrow rings beginning at the time of impact. “Cross-dating,” the matching of ring-width variation patterns in one tree with corresponding ring patterns in another, should be used to ensure that dating errors are not introduced by missing rings.

Missing rings can often be identified by drawing narrow rings in cross-dating progress. Control tree shows 23 annual rings between the 1472 and

1495 narrow rings (Figure 11), while the tree in the We (Mount St. Helens) tephra-fall zone shows only 20 rings. The series of missing and narrow rings starting with the 1482 ring were caused by tree injury during fallout of layer we. Because of possible missing rings, dates of past volcanic events cannot be determined unequivocally by counting back to a series of narrow rings (Brantley *et al.*, 1986).

Since, the same set of environmental factors influence tree growth throughout a region, the patterns of ring characteristics, such as ring widths, are often common from tree to tree. These patterns can be matched between trees in a process called crossdating (Figure 12), which is used to assign exact calendar year dates to each individual ring (The University of Arizona, 2013). The chronology provides two main types of information:

1. The chronology can be used as a tool for dating events that caused tree death or a

marked change in the appearance of a ring or set of rings. The death date can be used to date the tree cutting involved in the construction of wooden dwellings. Scars can record the timing of events such as fire, flood, avalanche, or other geomorphologic events, while sequences of suppressed or larger rings record events such as insect infestation, effects of pollution, or changes in forest dynamics.

2. The chronology is an average of coherent variations in growth from a number of trees. It enhances the common pattern of variation or “signal” -usually related to climate- while the non-common variance or “noise” is dampened. Chronologies from trees that are sensitive to climate can be used to reconstruct past variations in seasonal temperature, precipitation, drought, stream flow, and other climate-related variables (The University of Arizona, 2013).

Figure 11. Tree-ring cross-dating
(Brantley *et al.*, 1986)

Figure 12. Cross-dating according to the annual ring growth of different samples from live standing trees to old or new wood samples, Illustration showing an example of time series crossdating
(Adapted from Dendrologisches Labor Hamburg, 2015, <http://www.scinexx.de/dossier-detail-186-7.html>)

The techniques of dendrochronological study were used to date a spruce coffin board from Pukatawagan Bay, Manitoba received from Manitoba Historical Resources. The sample contained 74 annual rings, although the outermost 16 rings were rotten and not measured. The ring width series from the coffin board was matched against records from living spruce growing near South Indian Lake. Crossdating shows that the coffin board was cut in 1878. The board also contains a ring containing poorly developed latewood (a 'light' ring) in 1817 that is found commonly in spruce records across northern Manitoba (Figure 12)(Scott & Nielsen, 2002).

Using different wood materials of different periods, by cross-dating of the samples comparing with control one, it would be possible to record

and estimate changes from present time back to the ancient area (Figure 13).

Dr. Andrew E. Douglass, an astronomer, developed dendrochronology about 1913. Douglass used a bridging method to create his chronology. First he studied recently cut trees whose dates he knew. This initial step was critical because by knowing the cut date, Douglass knew when each tree added its last growth ring. This, in turn, let him determine the year each tree started growing. The calculation was straightforward: count the dark rings inward and subtract that number from the year the tree was cut. As Douglass matched and recorded ring patterns from trees of different ages, he confirmed that their patterns overlapped during the years the trees simultaneously lived (The University of North Carolina, 2013).

Figure 13. The bridging method, cross-dating of annual rings from present live tree to the past wood samples, for establishing a tree-ring sequence (Kuniholm, 2001)

FUTURE RESEARCH DIRECTIONS

Enhance and improvement of measuring methods on climate change issues in different sector is a crucial and important needs. Dendrochronology study method has several different applications. It is crucial to used dendrochronological method in medical field. Some question need to be considered and if possible answered. How medical needs could link with dendrochronological experiences? What kind of element may be detected on tree rings? How people could benefit of the results? What are the best analysis methods? By using this method we will be able to extend our work in medicine science areas and speed up medical approach with lower cost and economical saving (Jafari, 2014a).

CONCLUSION

The AFOLU sector (AR5, IPCC, WGIII, Chapter 11) is responsible for just under a quarter (~10–12 GtCO₂eq/yr) of anthropogenic GHG emissions mainly from deforestation and agricultural emissions from livestock, soil and nutrient management (robust evidence; high agreement) (Smith *et. al.*, 2014).

Climate change impact will cause changes in biomass production in natural ecosystems. It is a need to consider the vulnerability of Net Primary production (NPP) in forest ecosystem (Jafari, 2014b).

Climate change issue is an important subject in current century. In all possible ways we need to cope with this phenomenon to enhance our understanding knowledge. Dendrochronology as an able and certified study method could be implying in a wide range of applications.

KEY TERMS AND DEFINITIONS

AFOLU: Agriculture, Forestry and Other Land Use (AFOLU), main players on emission reduction and mitigation aspect of climate change, chapter 11, WGIII, IPCC AR5 2014.

Climate Change: Global Warming, climate change and climate variability are a definition of deviation of climatic factors from its normal trends mainly impacted by human activities. Global Warming and its' effects on natural resources, plants, animal and in general on human life are among subjects that received attention of scientists and politicians in recent years.

Dendrochronology: Dendrochronology was developed about 1913, and is a (climate change) method to study tree ring widths in terms of time. The word dendrochronology is composed of: dendro (using trees, or more specifically the growth rings of trees), chrono (time, or more specifically events in past time), and logy (the study of). Dendrochronology as an able and certified study method could be implying in a wide range of applications.

Proxy Data: Climate change assessments and evaluation should be done by using recorded observation data as well as prepared and provided proxy data. Paleoclimatologists (climatologists who study past – or paleo – climates) use the term “proxy” to describe a way that climate change is recorded in nature, within geological materials such as ocean or lake sediments, tree-rings, coral growth-bands, ice-cores, and cave deposits.

Tree Rings: Trees growing in temperate climatic region are under seasonal changes. In spring and summer time plants grow better than unpleasant seasons like fall and winter. Each growth layer is distinguished by early wood (springwood), composed of large thin-walled cells produced during the spring when water is usually abundant, and the denser latewood (summerwood), and composed of small cells with thick walls.

Model for Assessment of Environmental Responsibility in Health Care Organizations

E

María Carmen Carnero

University of Castilla-La Mancha, Spain & University of Lisbon, Portugal

INTRODUCTION

Sustainability is considered a paradigm for businesses in the 21st Century (Garcia et al., 2016). Despite this, the existing tools for helping to introduce strategies and manage activities to promote sustainable business are few (Garcia et al., 2016). These deficiencies become more important in Health Care Organizations owing to its particular conditions of resource consumption and waste production. Health Care Organizations are the only type of company which can generate all the classes of waste, from waste without risk to waste that is potentially infectious, carcinogenic, mutagenic, teratogenic or radioactive. The risk to people and to the environment from this waste is much greater if it is not correctly segregated. It is also vital to carry out action to reduce the consumption of limited natural resources such as water and energy, while increasing the protection and conservation of the environment, including reducing the emission of pollutant gases, protecting biodiversity or considering the role of suppliers in action to prevent or reduce waste.

It is, therefore, essential to have objective tools to assist in monitoring environmental sustainability in this type of organization, taking into account a number of factors. That is, by assessing how improvement actions, within a process of continuous improvement, are contributing to improvements in sustainability. However, it is clear that there is little linkage between sustainability reporting and management control systems (Cintra & Carter, 2012).

Nonetheless, despite its importance, the literature on the development of systems for environmental assessment in Health Care Organizations is very limited.

This Chapter therefore sets out a multicriteria assessment system constructed by extension to a fuzzy environment of the Technique for Order Preference by Similarity to Ideal Situation (TOPSIS), to assess the environmental responsibility of a Health Care Organization. This model allows joint evaluation of a significant number of decision criteria, which include any event that may cause adverse effects on water, ground, seas and rivers, wild species or their habitats; it also considers the existence of possible measures to be carried out in Health Care Organizations to minimize the probability of an event, or to eliminate all risk. However, it should be noted that this model is not intended to perform an environmental audit in the field of health care, as it would need to include economic, technical, legal and other criteria, or a system of environmental impact that would require the assessment of a variety of risks and consequences. The aim is to provide a hospital with a model which is easy to apply, with criteria specific to health care, and which allows its responsibility with regard to the environment to be monitored over time. Following the methodology laid down in Carnero (2015), criteria were used that were assessed depending on the number of admissions or annual services provided, making it possible to compare results over time for a single organization, or between organizations. The model has been used in a Public Hospital.

DOI: 10.4018/978-1-5225-2255-3.ch273

BACKGROUND

The literature includes a large number of contributions on environmental questions (Aragones-Beltran et al., 2009; Higgs et al., 2008; Hsu & Hu, 2008; Kang et al., 2007; Lamelas et al., 2008; Liang et al. 2006; Madu, Kuei & Madu, 2002; Pilavachi, Chatzipanagi, & Spyropoulou, 2009; Tzeng & Lin, 2005; Tseng, Lin, & Chiu, 2009; Van Calker et al., 2006). However, these are invariably related to manufacturing, transport or energy companies. In the case of service companies and, in particular, in Health Care Organizations, the contributions are practically non-existent (Carnero, 2015).

Health Care Organizations, places dedicated to the improvement and development of preventive measures in health care, with respect to their users, those who live in the area and their workers, should be involved in minimizing their own environmental impact, as there is a strong correlation between the two (Comunidad de Madrid, 2005). In order to improve environmental sustainability of a Health Care Organization, however, it is vital to monitor sustainability over time for decision making and management of activities that constitute an organization's system processes (Salvado et al., 2015).

A system of environmental assessment should combine many factors, which may be technical, social, political, economic and environmental, which often conflict with one another (Lahdelma et al., 2000); it may also be necessary to include a number of individuals or decision groups, with different perspectives or responsibilities within the Health Care Organization; as well as the need to incorporate a great deal of information, quantitative but in many cases qualitative, relating to uncertainties, scenarios, goals, etc. (Munda, 2005). These characteristics make the use of Multi-Criteria Decision Analysis (MCDA) methods highly suitable for supporting decisions about sustainability (Santoyo-Castelazo & Azapagic, 2014). The fact that the model produced, based on mathematical techniques, is objective, also helps to guarantee public acceptance of the solution or

result obtained (Huang, Keisler, & Linkov, 2011). MCDA methods then, although not suited to all environmental problems, are very convenient in environmental impact assessment, as they give information in a structured fashion, which can be easily interpreted by the decision makers (Neste & Karjalainen, 2013). All this has led to an increase in the literature applying MCDA in the environmental field over the last two decades (Carnero, 2014).

Because of the pressure brought to bear on companies by different stakeholders and by society to address ecological and social sustainability (Garcia et al., 2016) a variety of research has been carried out applying MCDA methods in this area. Gumus (2009) presents a methodology for selection of the most suitable hazardous waste transportation firms using a fuzzy Analytical Hierarchy Process (AHP). A similar technique is used by Heo et al. (2010) to get the weightings of the criteria to establish ex-ante and ex-post stages of renewable energy dissemination programmes in Korea. Reza et al. (2011) combine morphological analysis and AHP to choose new sustainable products from the earliest stages of conception. The study of Chan et al. (2012) is along similar lines, but using fuzzy AHP. Boran et al. (2012) use intuitionistic fuzzy TOPSIS to assess renewable energy technologies for electricity generation, such as photovoltaic, hydro, wind, and geothermal energy in Turkey. Wang et al. (2012) produce a model for selecting of green initiatives in the fashion industry. Vinodh et al. (2014) describe an assessment model to determine the best method for recycling plastics. Pourebrahim et al. (2014) made a selection of criteria and alternatives for conservation development in a coastal zone. Galvez et al. (2015) propose a model combining Mixed Integer Linear Programming optimization and AHP to assess possible scenarios for the implementation of an anaerobic co-digestion logistics network used to create sustainable energy production processes from biogas. Al Garni et al. (2016) use AHP to assess renewable power generation sources including solar photovoltaic,

concentrated solar power, wind energy, biomass, and geothermal, finding that in the case of Saudi Arabia the photovoltaic, followed by concentrated solar power are the first-placed technologies.

The literature which uses MCDA methods for the assessment of environmental sustainability and environmental impact includes the following contributions. Hermann et al. (2007) describe the tool COMPLIMENT, which allows the overall environmental impact of an organization to be found; they combine life cycle assessment, AHP and Environmental Performance Indicators (EPIs). Kaya and Kahraman (2011) use fuzzy AHP to build an environmental impact assessment methodology for urban industrial planning. Viaggi et al. (2011) develop and apply a multicriteria methodology to estimate the environmental effectiveness of European Union agri-environment schemes in Ireland and Emilia-Romagna (Italy). Larimian et al. (2013) use fuzzy AHP to assess environmental sustainability from the point of view of security in different areas in a region of Tehran. Egilmez et al. (2015) assess environmental sustainability in 27 Canadian and US cities using fuzzy multicriteria decision-making models. The research of Zhang et al. (2016) is also related to City sustainability evaluation via MCDA methods, in this case, of 13 cities in China. Khalili and Duecker (2013) describe a methodology for designing a sustainable environmental management system built using ELECTRE. This system serves as a back-up to monitor the efforts made by companies in the area of sustainability, for example through product design, operational development or the modelling of the supply chain. Salvado et al. (2015) use AHP to calculate a sustainability index which allows companies and their supply chains to get information about their own level of economic, social and environmental sustainability. A further review of the literature on environmental questions analysed via multicriteria techniques can be seen in Huang et al. (2011) and Neste and Karjalainen (2013).

However, in the field of environmental assessment of Health Care Organizations, the only contribution is Carnero (2014) which describes

a model using a fuzzy AHP together with utility functions. This model is applied to a recently opened public hospital, giving a utility of 0.764 out of 1, and showing how this type of model can be very positive in the process for certification to standard ISO 14001. Carnero (2015) shows another, more advanced, model also using fuzzy AHP, but assessing new criteria, and most are assessed based on number of care services provided annually, which allows results to be compared over time for one Health Care Organization, or between Health Care Organizations.

MODEL FOR ASSESSMENT OF ENVIRONMENTAL RESPONSIBILITY

The development of new information technologies, together with the development and application of new concepts in environmental sustainability, require a constant updating of the assessment models in this area.

The choice of criteria and subcriteria takes account of Rodríguez et al. (2005), García et al. 2010, Mata et al. (2011), Tejedor (2012), Bon-García (2012), Yanguas (2012), Galdakao-Usansolo Hospital (2012), Carnero (2014) and Carnero (2015). The criteria and subcriteria used in the multicriteria model are:

- Annual water consumption (C1).
- Annual energy consumption. Two subcriteria are considered:
 - Annual consumption (MW/h) by the Hospital of electricity, refrigerating energy, thermal energy and natural gas (C2).
 - Consumption of renewable energies (C3).
- Environmental accidents and incidents (C4). Accidents have potentially serious environmental implications, such as uncontrolled spillages into the water supply, fire, x-ray emissions, spillage of dangerous substances on the ground, leaks or

spillages of natural gas or diesel, spillage of acetylene or refrigerating gas, leaks of ethylene oxide, etc. Incidents are matters that give rise to internal non-compliance with standard ISO 14001 and require an analysis of the cause and corrective action. Although they are not as serious as environmental accidents, they should be analysed and their causes eliminated as quickly as possible. For example, unsuitable storage of waste or chemicals, complaints from patients or neighbours about noise, etc.

- Biodiversity (C5). An assessment is made of the capacity of the organization to adapt to the rural and forest environment, to take care of endangered species, and also of action taken to continuously improve the environmental impact of the organization.
- Activities to promote and spread the environmental message (C6). This includes annual planning of congresses, celebration, exhibitions, promotion of activities related to environmental prevention and protection, spreading of awareness of environmental aims of the Health Care Organization, etc.
- Training and cooperation on environmental matters (C7). The organization is assessed with respect to training programmes among care and non-care staff in the Health Care Organization, and planning of groups to analyse problems and improvements. This also considers the existence of surveys and systems for gathering complaints and suggestions, and for dealing with them efficiently.
- Noise inside and outside. This criterion is made up of the subcriteria:
 - Noise inside the Hospital (C8). This should not exceed 30dBA, and optimum noise is between 15 and 25 dBA.
 - Noise near the Hospital (C9). This should not exceed 55dBA, and optimum noise is between 35 and 45dBA.

- Waste production. Assess annual waste production. It is divided into the subcriteria:
 - Group I waste (C10). This is general waste, with no risk, such as edible oils, plastics, paper and cardboard, clothes, glass, etc.
 - Group II waste (C11). Sanitary waste that may be treated as urban waste.
 - Group III waste (C12). Dangerous waste products, including industrial oil, batteries, non-halogenated solvents, chemical waste, radiology liquid, out-of-date or retired medicines, anatomical remains with formaldehyde, cytostatic waste, etc.

Other waste, in other groups, including radioactive waste, is subject to special legislation which must be complied with, and so is not included in the assessment system.

- Green purchasing (C13). Inclusion in conditions for purchasing products and contracting services, of guarantees of respectful treatment of the environment. Assessment of suppliers with regard to certification with standard ISO 14001. Minimizing consumption of paper, cardboard and plastic in transactions and packages, etc.

All the criteria and/or subcriteria are assessed with respect to the number of annual admissions or services provided by the Health Care Organization. This means that the results can be compared over time for a single organization, and comparisons can also be made between Health Care Organizations (Carnero, 2015).

Although different multicriteria techniques can be used to build the model, in this case, applying fuzzy TOPSIS allows simultaneous valuation of a significant number of criteria.

A fuzzy MCDA will be used, as this allows the uncertainty, ambiguous situations or vagueness of the judgements of the decision makers to be

included (SeongKon et al., 2011). Furthermore, decision makers usually feel more confident in giving interval judgements rather than fixed value judgments (Isaai et al., 2011).

A triangular fuzzy number $\tilde{a} = (l, m, u)$ is defined by the membership function $\mu_{\tilde{a}}(x)$ which satisfies the conditions of normality and convexity. l , m and u are real numbers which satisfy $l \leq m \leq u$. The membership function is defined in Equation (1) (Chang, 1996).

$$\mu_{\tilde{a}}(x) = \begin{cases} \frac{x-l}{m-l} & x \in [l, m] \\ \frac{u-x}{u-m} & x \in [m, u] \\ 0 & \text{otherwise} \end{cases} \quad (1)$$

Kaufmann and Gupta (1988) give the main algebraic operations of triangular fuzzy numbers $\tilde{A} = (l, m, u)$ and $\tilde{B} = (l, m, u)$:

$$(l_1, m_1, u_1) \oplus (l_2, m_2, u_2) = (l_1 + l_2, m_1 + m_2, u_1 + u_2) \quad (2)$$

$$(l_1, m_1, u_1) \ominus (l_2, m_2, u_2) = (l_1 - l_2, m_1 - m_2, u_1 - u_2) \quad (3)$$

$$(l_1, m_1, u_1) \otimes (l_2, m_2, u_2) \approx (l_1 l_2, m_1 m_2, u_1 u_2) \quad (4)$$

$$(l_1, m_1, u_1) \oslash (l_2, m_2, u_2) \approx (l_1 / l_2, m_1 / m_2, u_1 / u_2) \quad (5)$$

$$(l_1, m_1, u_1)^{-1} \approx (1 / u_1, 1 / m_1, 1 / l_1) \quad \text{for } l, m, u > 0 \quad (6)$$

$$\lambda \otimes (l_1, m_1, u_1) \approx (\lambda l_1, \lambda m_1, \lambda u_1), \quad \lambda > 0, \lambda \in \mathbb{R}^+ \quad (7)$$

Fuzzy TOPSIS (FTOPSIS) was proposed by Chen (2000). In a decision problem with criteria $(C_1, C_2, \dots, C_n)$ and alternatives $(A_1, A_2, \dots, A_m)$, the best alternative in FTOPSIS is such that should

have the shortest distance to a fuzzy positive ideal solution (FPIS) and the farthest distance from a fuzzy negative ideal solution (FNIS). The FPIS is calculated using the best performance values for each criterion and the FNIS looks at the worst performance values.

In FTOPSIS the decision makers use linguistic variables to obtain the weightings of the criteria and the ratings of the alternatives. If there is a decision group made up of K individuals, the fuzzy weight and rating of the k th decision maker with respect to the i th alternative in the j th criterion are respectively:

$$\tilde{w}_j^k = (w_{j1}^k, w_{j2}^k, w_{j3}^k) \quad (8)$$

$$\tilde{x}_{ij}^k = (a_{ij}^k, b_{ij}^k, c_{ij}^k) \quad (9)$$

where $i = 1, 2, \dots, m$ and $j = 1, 2, \dots, n$.

The aggregate fuzzy weights $\tilde{w}_{ij}$ of each criterion given by K decision makers are calculated using Equation (10).

$$\tilde{w}_j = \frac{1}{K} \otimes (\tilde{w}_j^1 \oplus \tilde{w}_j^2 \oplus \dots \oplus \tilde{w}_j^K) \quad (10)$$

While to calculate the aggregate ratings of the alternatives Equation (11) is used (Ouma, Opudo, & Nyambenya, 2015).

$$\tilde{x}_{ij} = \frac{1}{K} \otimes (\tilde{x}_{ij}^1 \oplus \tilde{x}_{ij}^2 \oplus \dots \oplus \tilde{x}_{ij}^K) \quad (11)$$

A fuzzy multicriteria group decision-making problem which can be expressed in matrix format is shown in Equation (12) (Chen, 2000).

$$D = \begin{bmatrix} \tilde{x}_{11} & \tilde{x}_{12} & \dots & \tilde{x}_{1n} \\ \tilde{x}_{21} & \tilde{x}_{22} & \dots & \tilde{x}_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ \tilde{x}_{m1} & \tilde{x}_{m2} & \dots & \tilde{x}_{mn} \end{bmatrix}$$

$$\tilde{W} = (\tilde{w}_1, \tilde{w}_2, \dots, \tilde{w}_n) \quad (12)$$

where $\tilde{w}_j$ and $\tilde{x}_{ij}$ are linguistic variables which can be described by triangular fuzzy numbers.

The weightings of the criteria can be calculated by assigning directly the linguistic variables shown in Table 1. The ratings of the alternatives are found using the linguistic variables of Table 2 (Chen, 2000).

The linear scale transformation is used to transform the various criteria scales into a comparable scale. And thus we obtain the normalized fuzzy decision matrix $\tilde{R}$ (Rodrigues, Osiro, & Ribeiro, 2014).

$$\tilde{R} = [\tilde{r}_{ij}]_{m \times n} \quad i = 1, 2, \dots, m; j = 1, 2, \dots, n. \quad (13)$$

where

$$\tilde{r}_{ij} = \left(\frac{l_{ij}}{u_j^+}, \frac{m_{ij}}{u_j^+}, \frac{u_{ij}}{u_j^+} \right) \text{ and } u_j^+ = \max_i u_{ij} \text{ in the case of benefit criteria type}$$

$$\tilde{r}_{ij} = \left(\frac{l_j^-}{u_{ij}}, \frac{l_j^-}{m_{ij}}, \frac{l_j^-}{l_{ij}} \right) \text{ and } l_j^- = \max_i l_{ij} \text{ in the case of cost criteria type}$$

Next, the weighted normalized decision matrix, $\tilde{V}$ is calculated, by multiplying the weightings of the criteria $\tilde{w}_j$, by the elements $\tilde{r}_{ij}$ of the normalized fuzzy decision matrix.

Table 1. Linguistic variables for the weights

Linguistic Variables for the Weights	Fuzzy Number
Very Low (VL)	(0, 0, 0.1)
Low (L)	(0, 0.1, 0.3)
Medium Low (ML)	(0.1, 0.3, 0.5)
Medium (M)	(0.3, 0.5, 0.7)
Medium High (MH)	(0.5, 0.7, 0.9)
High (H)	(0.7, 0.9, 1.0)
Very High (VH)	(0.9, 1.0, 1.0)

(Chen, 2000)

Table 2. Linguistic variables for the ratings

Linguistic Variables for the Ratings	Fuzzy Number
Very Poor (VP)	(0,0,1)
Poor (P)	(0,1,3)
Medium Poor (MP)	(1,3,5)
Fair (F)	(3,5,7)
Medium Good (MG)	(5,7,9)
Good (G)	(7,9,10)
Very Good (VG)	(9,10,10)

(Chen, 2000)

$$\tilde{V} = [\tilde{v}_{ij}]_{m \times n} \quad \text{donde } \tilde{v}_{ij} = \tilde{x}_{ij} \otimes \tilde{w}_j \quad (14)$$

The distances d_i^+ and d_i^- of each weighted alternative from the FPIS and FNIS are calculated using Equations (15) and (16).

$$d_i^+ = \sum_{j=1}^n d_{\nu}(\tilde{v}_{ij}, \nu_{ij}^+) \quad (15)$$

$$d_i^- = \sum_{j=1}^n d_{\nu}(\tilde{v}_{ij}, \nu_{ij}^-) \quad (16)$$

where $d_{\nu}(\tilde{a}, \tilde{b})$ is the distance measured between the fuzzy numbers $\tilde{a}$ and $\tilde{b}$. This distance is calculated from Equation (17) (Rodrigues, Osiro, & Ribeiro, 2014).

$$d_{\nu}(\tilde{a}, \tilde{b}) = \sqrt{\frac{1}{3}[(l_a - l_b)^2 + (m_a - m_b)^2 + (u_a - u_b)^2]} \quad (17)$$

Finally, the closeness coefficient, CC_i , is calculated for each alternative i using Equation (18). This parameter allows the degree of fuzzy satisfaction to be evaluated for each Health Care Organization.

$$CC_i = \frac{d_i^-}{d_i^- + d_i^+} \quad (18)$$

SOLUTIONS AND RECOMMENDATIONS

The model was applied to a Health Care Organization whose mission is working to improve the health of the people it serves, with quality, safety and sustainability. It has 30 medical specialties, 386 beds and 1,744 staff, and provides medical cover to an area with 300,000 inhabitants.

An expert in environmental matters was used to obtain a pairwise comparison matrix for the decision criteria. The decision maker was asked to evaluate the importance of the criteria or sub-criteria that could be assessed by applying the fuzzy scale set out in Table 1. The resulting weightings are shown in Table 3. Next, the procedure is applied to evaluate each alternative (different years to be assessed in the Health Care Organization) via the linguistic variables from Table 2. This gives the fuzzy weighted normalized decision matrix shown in Table 4. The distances d_i^+ and d_i^- of each weighted alternative from the FPIS and FNIS are calculated using Equations (15) and (16), giving the results shown in Table 5.

The closeness coefficient of each alternative is set out in Table 6. From CC the ranking of the three alternatives is Hospital year 3, year 2 and year 1. The best result is obtained by the hospital in the third year assessed. This shows the process of continuous improvement undertaken by the Health Care Organization and allows a global follow-up to be carried out annually.

Table 3. Fuzzy weights

Criteria/Subcriteria	Weightings

FUTURE RESEARCH DIRECTIONS

AHP and fuzzy AHP are the most widely-used multicriteria techniques in the literature in general, and specifically in relation to the environment. However, this Chapter uses the fuzzy TOPSIS technique, due to the ease with which it can assess a large number of criteria and alternatives, but it would be appropriate to validate the environmental assessment models using other techniques successfully applied in a significant number of real cases, such as the Measuring Attractiveness by a Categorical Based Evaluation Technique (MACBETH).

Table 5. The distance measurement

Alternatives	d_i^+	d_i^-
Hospital year 1	7.035	6.984
Hospital year 2	6.223	7.700
Hospital year 3	6.104	7.813

(Created by the author)

Due to the constant evolution of information communication systems and the development of new technologies, with very dramatic effects on improvements in energy efficiency and consumption of natural resources, this model should be periodically reviewed to include new criteria or to up-date their definitions.

CONCLUSION

Health Care Organizations have an essential responsibility to the environment, being significant consumers of natural resources, as well as producers of large quantities of waste, some of which can cause serious risk to people and the environment unless they are properly handled.

The monitoring of a number of environmental matters is key to assessing continuous improvement in the actions undertaken. However, this monitoring requires objective tools which consider a series of criteria adapted to each organization.

This Chapter therefore presents a multicriteria model for assessing environmental responsibility in Health Care Organizations. The intention is that the model, although based on mathematical tools, should be easy to apply, and should take into account the uncertainties and ambiguities which characterize the real-life decision process. The fuzzy TOPSIS technique was thus used, as it allows a large number of alternatives to be assessed in a simple manner, which means the results obtained can be compared over time.

Table 6. Closeness coefficient of each year assessed

Alternatives	CC
Hospital year 1	0.498
Hospital year 2	0.553
Hospital year 3	0.561

(Created by the author)

To test the utility of the model, it was applied in a public Health Care Organization over three consecutive years, showing how the improvement actions undertaken increase the overall utility of the result.

KEY TERMS AND DEFINITIONS

Multi-Criteria Decision Analysis: It is a part of operations research that use multiple criteria in decision-making processes providing acceptable compromise solutions when criteria are in conflict. There is a relevant quantity of tools belonging to this category, for example Analytic Hierarchy Process (AHP), Analytic Network Process (ANP), Measuring Attractiveness by a Categorical Based Evaluation Technique (MACBETH), ELimination Et Choix Traduisant la REalité (ELECTRE), Multi-Attribute Utility Theory (MAUT), The Preference Ranking Organization METHod for

Enrichment of Evaluations (PROMETHEE), etc. The MCDA techniques allow to construct objective models to improve understanding of underlying decision processes in the systemic processes.

TOPSIS: The Technique for Order of Preference by Similarity to Ideal Solution (TOPSIS) is a multicriteria decision-making approach created by Hwang and Yoon in 1981. It is a compensatory aggregation method based on the concept that the best alternative should have the shortest geometric distance to a positive ideal solution (PIS) and the geometric farthest distance from a negative ideal solution (NIS).

E

Potential Benefits and Current Limits in the Development of Demand Response

Clementina Bruno

University of Piemonte Orientale, Italy

INTRODUCTION

Once upon a time, for many families, electricity was a somehow magic and mysterious stuff allowing houses lighting and appliances operation, whose secrets began just behind the switch or the socket. Other, more informed, users knew that it came from generation plants and “travelled” along a grid towards houses or firms. Nowadays, the role of end users has changed a lot. They have a broader knowledge of the electric system, and a certain awareness of being part of it, in some cases not simply as consumption units. Distributed generation (such as residential photovoltaic production) and demand response mechanisms have transformed (residential, industrial or commercial) users in an active part of the electricity supply chain, so that they are often defined as “prosumer” (Crispim et al., 2014).

In particular, Demand Response (DR) is attracting increasing attention from regulators, policy makers and system operators due to its large potential in supporting and, in some cases, substituting generation in providing flexibility to the system. This corresponds, on the academic side, to an exponential growth of scientific production, with focus on the technical or on the socio-economic features of the issue. This chapter will provide a review of some recent contributions on this topic. Far from being exhaustive of the extremely wide related literature, the aim of this chapter is to provide a general presentation of the issue, briefly discussing the main benefits related to DR, as well as the most relevant regulatory, technological and

socio-economic challenges that can slow down or hinder its development. Therefore, this work will provide an analysis of the impact and issues related to DR from a socio-economic perspective. Moreover, it will also briefly consider the role of technology (especially information and communication technology) in supporting DR implementation and, more in general, the evolution towards “smart” systems. The rest of the chapter is organized as follows. The next section defines DR and illustrates the most relevant benefits of its development. Subsequently, challenges to DR development are discussed and some recommendations are provided. Future research directions and conclusions close the work.

BACKGROUND

The literature provides a wide set of definitions of DR. Quite common across these definitions is the focus on end-users and on the modification in their electricity utilization patterns (see, for instance, the list provided in Eid et al., 2016). For example, in the FERC (Federal Energy Regulatory Commission) website¹ DR is defined as

Changes in electric usage by demand-side resources from their normal consumption patterns in response to changes in the price of electricity over time, or to incentive payments designed to induce lower electricity use at times of high wholesale market prices or when system reliability is jeopardized.

There are several typologies of DR mechanisms, which can be classified following different criteria (Vardakas et al., 2015). Here we propose the most common classification.

- Time-based retail rates (Cappers et al., 2012), also called rate-based or price-based programs (Siano, 2014), or implicit DR (SEDC - Smart Energy Demand Coalition, 2015), provide incentive to end-users to modify their consumption as response to price variations. Price fluctuations are designed to reflect the dynamics of the wholesale market price or the grid tariff, and ultimately, of the cost of the electric service. Prices can be predetermined but different for given time periods or move dynamically depending on the system and market contingencies.
- Incentive-based retail programs (Cappers et al., 2012), also defined as event-based programs (Siano, 2014), reliability-based (Shen et al., 2014) or explicit DR schemes (SEDC, 2015) reward consumers through a payment or a bill credit for a reduction in their consumption. Such mechanisms are activated by the entity managing DR services (users can contract directly with the utility or with an aggregator) in response to particular events affecting the electric system, e.g. network congestion².

Examples of price-based DR programs are:

- Time of Use tariffs, where prices are different but fixed for given time periods (e.g. times of the day or days of the week).
- Critical Peak Pricing, that applies particularly high prices for a limited period (few hours) in response to critical technical or economic/market events.
- Critical Peak Rebate, where consumers are recognized a bill rebate if they reduce their consumption below a pre-specified baseline during critical hours.

- Real Time Pricing, where prices vary dynamically (e.g. every hour) following the wholesale market price and/or the actual generation costs.

Common forms of incentive-based mechanisms, instead, are:

- Direct Load Control, where the utility has the opportunity to manage directly some consumer's equipment (e.g. air conditioning or heating).
- Interruptible/Curtailable programs, where (usually large) users accept that (a part of) their load can be disconnected, in some cases even without notification.
- Emergency DR programs, which provide end-users a compensation to reduce their loads when the system reliability is endangered.
- Ancillary Service Programs, where consumers provide "reserves" by committing to reduce their load in case of necessity.

For further examples or deeper descriptions of DR programs, see, among the others, Cappers et al. (2012), Darby and McKenna (2012), Shen et al. (2014), Siano (2014), Hu et al. (2015), Vardakas et al. (2015). Figure 1 reports some examples of DR programs.

While some mechanisms are well suited even in "traditional" electric systems (e.g. Interruptible/Curtailable programs), other ones present important technological requirements, and can develop their full potential when implemented in smart grid contexts (e.g. Real Time Pricing).

Following Siano (2014; p.462), a smart grid (SG) is "an electric grid able to deliver electricity in a controlled, smart way from points of generation to consumers that are considered as an integral part of the SG since they can modify their purchasing patterns and behavior according to the received information, incentives and disincentives". This definition highlights some relevant peculiarities of SGs with respect to tra-

Figure 1. Examples of DR programs

ditional grid structures. First, energy is delivered from generation “points”, rather than generation “plants” (thus the definition encompasses also distributed generation). Second, consumers are active subjects, because they provide services to the electric system, by modifying their behaviour. Third, such modifications are driven by (system or economic) information that consumers receive; however, we must notice that also the information flow to the utility is crucial, since it allows the application of the correct incentive or price schemes. This information exchange relies on the implementation of advanced technologies such as those embedded in smart meters, and is not possible with traditional equipment. Therefore, in SGs, both information and energy can flow from the utility to the users and vice versa, as represented in Figure 2. Finally, the delivery of power is “controlled”

and “smart”, suggesting continuous adjustments of demand and supply to ensure high efficiency in the whole service provision.

DR (especially incentive-based programs) has led to the emergence of a new subject in the electricity value chain, i.e. the aggregator. The aggregator is a market intermediary that “aggregates” the DR capacity from consumers that do not have sufficient dimension, information, knowledge, technology, reliability or availability to participate directly in electricity markets. Usually, the aggregator is an electricity supplier or an independent intermediary (SEDC, 2015; Eid et al., 2015).

The potential positive effects of DR on the electric system and, more generally, on users and on the community as a whole are broadly recognised at the political level. For instance, in the European

Figure 2. Energy and information flows in smart grids

context, the Electricity Directive (2009) and the Energy Efficiency Directive (2012) recognise the opportunities related to DR development and encourage Member States to foster this form of flexibility and to remove potential barriers (e.g. regulatory barriers) to the effective participation of users in the electricity market.

The advantages deriving from the implementation of DR programs are numerous.

Firstly, DR provides system flexibility that can be effectively employed to contrast the intermittency and limited predictability of some Renewable Energy Sources (RES), such as wind and solar. This is especially the case of Real Time Pricing, within the price-based mechanisms, and of several incentive-based programs, such as Direct Load Control (Cappers et al., 2012). Secondly, DR improves the general system reliability, e.g. by reducing demand in case of outages, thus supporting the system recovery, as highlighted by Siano (2014)³. Thirdly, DR programs help flattening consumers' demand, for instance by leading them to reduce consumption or to shift it to off-peak periods. In the short term, this reduces the global generation costs, by limiting the use of expensive peak generation technologies. Moreover, in the long term, this reduces or defers new investments in generation or grid capacity. These cost savings can turn into benefits for consumers. In fact, users participating to DR programs may enjoy lower bills or other compensations for their flexibility. Lower tariffs induced by lower wholesale price, however, will benefit all users, even non-participant ones. Fourthly, non-activation of peak units reduces the related emissions. Fifthly, the "distributed" nature of DR resources is also able to reduce the

network losses associated to transmission and distribution. Finally, a more elastic demand limits the possibility of generators to exert market power. (Batlle and Rodilla, 2009; Darby and McKenna, 2012; Siano, 2014; Shen et al., 2014; Gils, 2014; Hu et al., 2015; Eid et al., 2016).

Several scientific works support the desirability of DR programs, from different perspectives. For instance, Feuerriegel and Neumann (2016), relying on a mathematical model and German data, find that, when DR is employed for load shifting, it can generate savings in the order of 2.83%. Brouwer et al. (2016) employ a simulation tool to evaluate the economic impact of RES penetration for the year 2050. The results show that system costs would increase with RES penetration, due to investments and RES intermittency, but this effect could be counteracted by some options, including DR development. Dupont et al. (2014) run a simulation based on Belgian data and find that DR reduces system costs and emissions while improving reliability. Schleich et al. (2013) analyse econometrically the results of a trial in Austria and show that receiving feedback on consumption can induce households to reduce electricity use by 4.5% on average. Conversely, Torriti (2012) finds that Time-of-Use tariffs in Northern Italy generate lower bills, but higher average consumption. DR effectiveness for load shifting is supported, but limited to morning peaks. Finally, Bradley et al. (2013) rely on an extensive review of the literature and find support to the economic sustainability of DR in UK markets.

Notwithstanding the broad evidence in favour of DR, its development is just in a starting phase and proceeds slowly, with limited consumers'

involvement (Hu et al., 2015). This likely depends on the complexity of adopting and managing DR programs, related to a set of existing challenges hindering DR development. In the following section, some relevant challenges will be discussed.

REGULATORY, TECHNOLOGICAL, AND SOCIO-ECONOMIC CHALLENGES TO DR DEVELOPMENT

Regulatory Challenges: DR Potential and Current Regulation in Europe

In order to understand the potential limits to DR development, we provide an example referred to the European case. SEDC (2015) reports an evaluation of the regulatory framework supporting explicit DR in 2015⁴ for 16 European Countries. Regulation is evaluated with respect to four main “areas”: “consumer access and aggregation”, “program requirements”, “measurement and verification”, “finance and penalties”. Each country receives a score for each area and an overall score resulting from their sum. Higher values correspond to environments more favourable to DR development. Results show that some states have reached an advanced level in the regulation aimed at promoting DR and consumers empowerment, whereas other ones still present relevant inconsistencies between this target and their actual regulatory framework. These differences across countries are highlighted by the diversified grades reported in the last column of table 1, which range from 16 for France and Switzerland (a star indicates existing standardized arrangements involving aggregators) to 3 or 2 for Italy and Spain, respectively.

It is interesting to compare this evaluation with the results reported in Gils (2014). The author provides an assessment of the theoretical DR potential in Europe and some North-African Countries (“theoretical” indicates that the potential includes all equipment available for DR purposes, independently from possible constraints

due to technological, economic, legal issues, etc.). Results are detailed by consumer type and by country, and demand flexibility potential is evaluated either in terms of load reduction (due to load shedding or shifting by delaying consumption) and load increase (related to load shifting by anticipating consumption). Focussing only on the 16 Countries analysed in SEDC (2015), we provide, in the second and third columns of table 1, rankings constructed on the basis of the potential load increase or reduction (originally expressed in MW by Gils, 2014). We can see that these two rankings are quite similar, and their comparison with the last column allows some reasoning. France and UK, that present very high DR potentials and favourable regulatory frameworks, seem to be isolated cases. Several other countries with noticeable potential (Germany, Italy, Spain) present very low SEDC grades. Conversely, countries like Switzerland or Ireland, whose regulatory frameworks are supportive to DR, can exploit only limited potential. Keeping in mind the limitations related to the fact that SEDC (2015) focuses only on incentive-based DR, nevertheless we can conclude that there is an inconsistency between the regulatory evolution and the amount of DR resources that could be exploited. In fact, several states are neglecting the opportunity offered by DR, or, at least, are accumulating an important delay in fostering its development. This happens especially for countries where DR benefits could be large.

In SEDC (2015), the main regulatory limits in promoting DR seem to be related to the area “Consumers participation and aggregation”, for several reasons. For instance, in a number of states, DR resources continue to be excluded from some markets, and generation is still the favourite source of flexibility. In some cases, markets are open to DR, but not to aggregated load, thus limiting the participation of medium or small users. Moreover, the possibility of end-users of freely choosing their DR services provider is often limited.

Other limitations appear also with respect to other “areas”. For example, excessively high

Table 1. DR potential and actual regulation in Europe (our elaboration from SEDC, 2015, and Gils, 2014)

Country	Ranking Based on Potential Load Reduction (Gils, 2014)	Ranking Based on Potential Load Increase (Gils, 2014)	SEDC (2015) Grade
Austria	13	12	10
Belgium	10	11	12
Denmark	14	14	8
Finland	9	10	12
France	2	1	*16
Germany	1	2	6
Ireland	15	15	12
Italy	3	4	3
Netherlands	8	9	10
Norway	11	8	10
Poland	6	6	4
Slovenia	16	16	6
Spain	4	5	2
Sweden	7	7	10
Switzerland	12	13	*16
UK	5	3	12

capacity thresholds to access the market, or other unnecessarily binding requirements (probably a result of older market rules designed for large generators only) in terms of DR events duration or frequency can limit consumers' participation. The fairness and the transparency of the methodologies for measuring the actual consumption reduction constitute another issue, together with the procedures to determine the standard consumption "baseline" (i.e. the starting point for evaluating reductions). Moreover, in some cases, participation to DR programs is subject to the provision of relevant bank guarantees, which can constitute a further barrier.

Some of these points are highlighted also in ENTSO-E (European Network of Transmission System Operators for Electricity, 2015), that also underlines, in a discussion including price- and incentive-based programs, the "lack of effective-

ness of price signals" (p. 5), as well as the limited price variability in some retail markets, especially for medium-small users. This limits both the ability of prices to reflect actual energy costs and the related consumers' responsiveness. Moreover, to ensure small consumers' participation to DR programs, it is necessary that "price signals remains understandable and manageable" (p. 6).

Technological Challenges: Technology Requirements for Effectively Exploiting DR Potential

In order to be effective in providing DR resources, consumers need to interact actively with suppliers or DR services providers. Moreover, they need to be able to react promptly to price or event-driven signals requiring DR activation. This is often not feasible through manual intervention, especially when signals are frequent or provided with very short notice (Cappers et al., 2012).

To deal with this issue, an extended deployment of smart technologies appear necessary, as well as adequate communication and standardization. Below, these concepts are briefly introduced (see Siano, 2014; Shen et al., 2014; ENTSO-E, 2015; Hu et al., 2015; Vardakas et al., 2015).

Among smart technologies, a key role is played by Advance Metering Infrastructures (AMI), systems able to measure electricity usage, to save and analyse the related data, to receive information from devices and to exchange information with utilities. Important components of AMI are smart meters, electronic devices able to measure users' consumption at fixed time intervals (e.g. one hour) and communicate data to suppliers.

In addition, automation technology allows consumers to program "smart" appliances (such as specifically designed washing machines or refrigerators) or control devices (e.g. "smart thermostats") to automatically respond to event or price signals. For instance, "smart thermostats" can adjust the temperature of rooms in response to electricity price variations. Home Area Networks (HAN) can be employed for connecting

all these home devices among each other and with the utilities.

Finally, it is relevant to underline the key role of communication. For an effective use of the communication infrastructure, integration among networks should be promoted, and this would require the adoption of open communication standards. Concerning communication systems (Siano, 2014), they can be one-way (information and DR signals flow from the utility to the end-users), or more expensive but more effective two-way systems, that, additionally, allow utilities to receive feedback in relation to consumers response (e.g. smart meters). They can be wireless (e.g. relying on cellular networks) or wired. The latter can rely, for instance, on power line communications (PLC, either broadband or narrow band), suitable at local level and not requiring new infrastructure building, or on optic fiber communications, for longer distances. The key role of communication highlights the importance of security (Vardakas et al., 2015), either in terms of protection of consumers' sensitive data and privacy, or in terms of preservation of system and market information from external inference or attacks that can create damages or inconvenience.

Economic and Social Challenges

From the purely economic perspective, two major issues, somehow interrelated, concern the provision of sufficient economic incentives to participate to DR programs (ENTSO-E, 2015) and the distribution of investment costs related to enabling technologies. With respect to the latter point, Eid et al. (2016) underlines the problem of correctly splitting DR cost and benefits along the whole electricity supply chain (e.g. among network operators, retailer and consumers), in such a way to create positive business cases for all the involved parties. Failing in providing proper mechanisms to reach this goal generates the risk that none of the parties would chose to make the "first move" (p. 22). The authors report an example related to investments in smart meters. Moreover,

they state that, as the (environmental) benefits of such programs would affect the whole society, this should be the case also for costs. Also Shen et al. (2014), with a similar line of reasoning, suggest that incentives to DR participation and investments could effectively receive public support, in consideration of their positive impact on the society. Hu et al. (2015) states that utilities do not have sufficient incentives to support DR in absence of subsidies. ENTSO-E (2015), however, stresses that general subsidization of DR programs must be minimal and avoid market distortions, since DR "must achieve its full economic potential in fair competition with other sources" (p.8).

Turning, now, to the former point, as highlighted by Cappers et al. (2012), "the opportunities created by the DR service providers must generate sufficient value to customers or else they will eschew these offerings" (p.426). In this perspective, with specific regards to residential users, Darby and McKenna (2012) underlines the key role of rates. Cappers et al. (2012) stress also that a sufficient remuneration is necessary for DR service providers as well, which will be in charge of marketing and managing customers' involvement in DR programs. These points highlight the crucial role played by the design of DR mechanisms: advanced optimization methods provide relevant support in this sense. Vardakas et al. (2015) report a broad survey and discussion of optimization models for DR, highlighting the plurality of available options. For instance, the objective function(s) of the optimization problem may target the minimization of electricity costs or of total consumption, or the maximization of social welfare, or combine two of these objectives. Moreover, based on the form of the objective functions or of the constraints, the optimization problem can be linear or non-linear, while the variable characteristics can lead to integer or mixed-integer optimization problems; each type of problem requires an appropriate technique to be solved. Different sources of complexity can arise in dealing with such models, e.g. problems with no feasible solutions or excessive computational

times. Additionally, game theory provides valuable theoretical support to model the interactions among electric system actors (users or utilities). For a deep discussion and examples of optimization algorithms in the context of DR and SGs, see Vardakas et al. (2015) and the references therein.

Moreover, there are some social and cognitive issues potentially affecting users' willingness to be involved in DR, and this holds especially for residential users. In fact, apart from the gratification that can derive from the idea of having contributed to improve the system reliability (Siano, 2014), users could be affected by some kinds of inconvenience. First, they will need to change some consumption habits: while some activities can be more easily shifted to a different moment in time, other activities, such as cooking (and eating) are less likely to be suitable for variations (Darby and McKenna, 2012). In addition, some consumers could have a limited willingness to accept high levels of automation and external control of their activities by a "Big Brother" (Cappers et al., 2012, p.425). Darby and McKenna (2012) suggest that home automation could effectively involve heating and cooling, as well as electric vehicles, while consumption related to other activities can be managed manually. Moreover, the same contribution highlights that consumers used to flat rates are not likely to switch easily to variable tariffs, and that a gradual passage to Time of Use pricing and subsequently to the more effective, but more complex, Real Time Pricing could represent a feasible path.

Many of the mentioned authors, however, agree on the key role of consumers' education and information in order to overcome most of the social issues described above, as long as the DR services providers will be able to achieve a high level of trust from customers and to provide an adequate protection of their rights and privacy.

SOLUTION AND RECOMMENDATIONS

Throughout this chapter, we have drawn a picture of DR as a promising resource developing in the electric system that, however, still presents many unknown features, which make difficult evaluating its potential, thus slowing down or limiting its development.

As in any other case where something "new" is developing on a broad (in this case global) scale, also with respect to DR it is important that all the involved actors (Governments, regulators, utilities, users, etc.) can make their choices on an informed basis. Therefore, as highlighted in Hu et al. (2015), it is crucial that further studies are promoted and developed.

In my opinion, such studies could focus on several fields and adopt different methodologies (examples can range from game-theoretical studies aimed at identifying the best market design to field trials evaluating the practical consequences of specific projects). A multi-disciplinary approach involving different entities, professional figures and expertise (e.g. regulators and utilities, practitioners and academics) seems the most promising strategy, given the multiplicity of perspectives that need to be considered to effectively deal with such a broad issue.

FUTURE RESEARCH DIRECTIONS

Future research focused on DR can take manifold directions. With reference to the economic and social sciences fields, some (not exhaustive) examples could be the following.

- Direct evaluations of consumers' preferences and willingness to accept contracts

including different kinds of DR programs could be performed by adopting surveys approaches relying on contingent valuation or conjoint analysis. These approaches can be implemented describing hypothetical scenarios to generic consumers, or directed to subjects involved in actual trials or pilot studies. These methods can be designed also to infer the correct level of monetary incentive to be provided.

- DR affects system operations. Efficiency analysis techniques (parametric and non-parametric) can be effectively employed to evaluate the impact of DR on the performance of firms operating in different phases of the supply chain (generation or network management).
- A more general approach based on cost-benefit analysis, adopting a macro-economic perspective, appears crucial for evaluating specific programs before their implementation. Such an approach should be able to incorporate also non-monetary elements, such as environmental benefits related to reduced emissions.

CONCLUSION

Interest in DR as a source of flexibility is increasing from several direction (policy makers, regulators, utilities, academics and users). The potential benefits related to DR development are numerous and extremely interesting. Nevertheless, the implementation of such programs is still in a starting phase and is advancing in a relatively slow way. This is due to the complexity of the management of this new resource. This chapter has analysed the main regulatory, technological and socio-economic challenges to DR development. As a conclusion, the level of knowledge of the issue needs to be expanded in order to support informed decision-making, and multi-

disciplinary approaches can constitute, as this article has discussed, an effective strategy given the multiplicity of perspectives to be considered in dealing with DR issues.

KEY TERMS AND DEFINITIONS

Demand Response (DR): Source of flexibility for the electricity system relying on modifications in users' consumption.

Enabling Technologies: With respect to DR, this term indicates those technologies (e.g. equipment, appliances) that allow an effective implementation of DR programs. Examples could be smart meters, allowing communication between users and utilities, or home appliances that automatically react to price or non-price signals by modifying electricity consumption.

Incentive-Based DR: DR mechanisms that rely on consumption modifications induced by non-price signals, for which the involved users receive compensations.

Off-Peak: Points of lower demand (with respect to the peak-load) in a certain time period.

Peak-Load: Within the electric system, it is the point of highest demand in a certain time period. We can have daily peaks, seasonal peaks, etc.

Peak-Shifting: Refers to the possibility of moving demand from peak to off-peak times. This is one of the desirable effects of DR.

Price-Based DR: DR mechanisms that rely on consumption modifications induced by price variations.

ENDNOTES

- ¹ <http://www.ferc.gov/industries/electric/indus-act/demand-response/dem-res-adv-metering.asp>
- ² Siano (2014) identifies as a separated category demand reduction bids, where participant send their bids (offer a demand reductions and request a price) to the utility or the aggregator.
- ³ The authors refers to DR benefits in a SG context, but most of the proposed lines of reasoning are likely to apply in a more general framework.
- ⁴ As mentioned in the report, explicit DR has limited requirements in terms of public investment in technology, therefore regulation plays the more critical role in making DR programs available and suitable for end-users.

Waste Gas End-of-Pipe Treatment Techniques in Italian IPPC Chemical Plants

INTRODUCTION

Due to more stringent emission regulations, very efficient new advanced emission control technologies are required adopting National IPPC (Integrated Pollution Prevention and Control) Permits (below AIA) based on Best Available Technologies (below BAT) Conclusions.

Some of these techniques are operating inside Chemical Plants and Refineries based in Italy, such as Oxidation, Adsorption and Absorption devices. Other techniques (i.e. the ones that are new advanced technologies still in research or in demonstration state), are not subject of this Paper, based on describing running situation inside operating IPPC Chemical Plants and Refineries licensed in Italy at National Level.

This paper includes, but are not limited to, the results of a screening of Italian Chemical IPPC Industries and Refineries up to day, trying

to highlight operating conditions and possible already existing improvements for removal of:

- VOC and other cancer causing and toxic substances;
- Dust, Mercury and heavy metals;
- NO_x and Nitrogen compounds;
- SO_x and Sulphur compounds;
- Chlorides and Fluoride compounds.

The abatement techniques analyzed in this work operate mainly on VOC content reduction, through the use of Oxidizing devices or on inorganic compounds abatement (in addition to VOC), through the use of Absorption or Adsorption devices.

Superior Environmental Protection and Research Institute (below ISPRA) experience, mainly developed as Technical Support to Italian Minister of Environment, Land and Sea (below IMELS),

has allowed to analyze different operative conditions, related with abatement techniques and their application in IPPC permitted plants.

Many pollutants emitted from IPPC plants (according to Environmental Permits limit values) have been identified and charted a profile of possible application for abatement techniques in these plants in their different IPPC categories.

The results of this analysis allow to suggest a possible reconsideration and, also, new assessment for some end-of-pipe devices, in order to find other better defined operational contexts, different from actually Italian provisions and, also, an evaluation of current operational performances of the devices, in order to improve their environmental conditions, consistently with BAT application.

BACKGROUND

In Italy, IPPC Permit is an authorization released for environmental protection purposes, in order to prevent and control pollution ‘at the source’ by means of an integrated authorization, allowing operation of IPPC industrial activities with specified production’s characteristics and dimensions, at both national and regional levels (Battistella, 2013).

The list of the categories of these specific industrial activities is regulated by the Italian Legislative Decree n. 59/2005 and s.m.i. (Italian Legislative Decree n. 152/2006 and s.m.i.) that adopts and endorses the Directive n. 96/61/EC and s.m.i. (Directive 2008/1/EC and s.m.i.) concerning integrated pollution prevention and control (actually recast in the Directive 2010/75/EU).

IPPC permits – by law definition - plan and perform an integrated prevention and control set in the exact point of pollution (‘a la source’), e.g. pollutants are identified, declared, controlled, detected and monitored in the admission/emission points of the IPPC industrial activities, as well as during all activities of industrial plants’ operation (Battistella & Di Marco, 2013a; Battistella & Di Marco, 2013b).

This means authorization of plants’ operation controlling natural resources’ usage, as well as emissions and discharges in the environment inside predefined limit values with prescriptions, adoption of predefined monitoring framework, as self-controls on selected parameters, frequencies and methodologies, with a periodic reporting and planned inspections based on the effective environmental risk (Battistella & Di Marco, 2013a; Battistella & Di Marco, 2013b).

In Italy, AIAs are released by the Competent Authority, as

- By IMELS for national strategic plants;
- By other Authority designed by Region or autonomous Province for others.

In order to accomplish IPPC permits operative performances in terms of assigned limit values, among other provisions, also waste gas end-of-pipe treatment devices are adopted - as well as installed and operated - in order to abate or at least decrease pollutants’ contents (even often dangerous substances and compounds) in *waste-gases* before their emission into open air.

Adopted techniques must be considered equal to, or committed to become under IPPC permits period of duration (more or less 10 years), as Best Available Techniques and their operating performances are described in details into *Reference Documents on Best Available Techniques (BRefs¹)*.

BAT CONCLUSIONS APPLICATION IN ITALIAN IPPC PERMITTED PLANTS

The Italian National Environmental Regulatory Framework for IPPC Installations

As regards to Italian Regulations, Attachment X to Part II of Legislative Decree n. 152/06 ^[9] defines the list of main pollutants to be monitored,

if pertinent, with reference to air emissions for IPPC Plants under operational licensee.

Attachments to Part V of Legislative Decree n. 152/06 list minimum emissions values (relevance thresholds) and maximum emissions values (limit values) and related prescriptions (continuous monitoring, process parameters to monitor, measurements' norms, continuous monitoring control procedures, conformity criteria for measurements, etc.) for pollutant substances emitted in atmosphere - as conveyed emissions - at the stacks and specific indications for some substances (as SO_x, NO_x, CO, Dusts, VOC, etc.) and for some types of plants.

It is relevant to highlight that Legislative Decree n. 152/06 *does not establish specific limit values for emissions of pollutants from end of pipe treatment devices*, as well as *does not even describe specific abatement techniques*.

This is why applied emission limit values are strictly connected with specific pollutants and plant units from where they are generated, as mentioned in Suppl. Annex I at V Part of Italian Legislative Decree n.152/06.

Table 1 shows main pollutants related with operative experience in Italian IPPC plants.

In III Part of mentioned Annex I, emission levels for some specific type of production such

Table 1. Main pollutants related with operative experience in Italian IPPC plants

Pollutant	Class Identity (Annex I, V Part of Italian Legislative Decree n.152/06)	Relevance Threshold (g/h)	Limit Value (mg/Nm³)
Point 1.1. Cancer-causing, reproduction toxic or mutagen compounds (Table A1)			
Benzene	class III	25	5
PHA (summation)	class I	0,5	0,1
Organic chlorated compounds	class III	25	5
Point 1.2. Compounds that can be especially toxic and be accumulated (Table A2)			
Dioxins and Furans	class I	0,02	0,01
PCB	class II	0,5	0,5
Point 2. Inorganic compounds that mainly come up in dust form (Table B)			
Hg	class I	1	0,2
Point 3. Inorganic compounds that mainly come up in vapour or gas form (Table C)			
SO _x	class V	5000	500
NO _x	class V	5000	500
Chlorine	class II	50	5
Chlorine inorganic compounds (as HCl)	class III	300	30
Fluorine and its compound (as HF)	class II	50	5
H ₂ S	class II	50	5
NH ₃	class IV	2.000	250
Point 4. Organic Compounds that come up in dust, vapour or gas form (Table D)			
Organic compounds (included Chlor Aromatics, Halogenic hydrocarbons and Nitro aromatics compounds)	It depends on the specific compound		
5. Total dust			
Total Dust	-	> 5000	50
		>1000 <5000	150

as Non ferrous metal, Sulphuric acid, Chlorine, Fertilizers, polymers are described, while in IV Part emission levels for Refineries are described.

For VOC in Annex III at V Part of Italian Legislative Decree n.152/06, emission levels for particular type of compound are described as shown in the following Table 2.

Screening of IPPC Permitted Chemical Plants and Refineries in Italy

In Italy, at December 2014, are operating 175 activities so called “strategic” (IPPC permits released at national level) and between these there are: 16 Crude Oil Refineries and 46 large Chemical Plants and about 5.560 Plants have received IPPC Permits, while almost 200 are concluding their procedures (no one with critical conditions

to be resolved for EU obligations) in terms of first release (Superior Environmental Protection and Research Institute [ISPRA], 2015).

Figure 1 shows the IPPC Permits situation at the beginning of year 2013 (ISPRA, 2015).

In the Italian procedure to release IPPC permits, ISPRA is on charge of performing the requested comparisons of environmental parameters with the applicable ‘Best Available Techniques’ - contained inside available published BRef documents – in order to evaluate and to propose to the ‘Technical Investigating Group’ appropriate limit values, prescriptions and recommendations to be adopted in the ‘Technical Advice’, to be approved (Battistella, 2013; Battistella & Di Marco, 2013a; Battistella & Di Marco, 2013b).

In this way, also a virtual process is started, in order to compare industrial activities and plants’ performances in term of ‘resource efficiency’,

Table 2. Emission levels for VOC

Pollutant	Identity	Relevance Threshold (g/h)	Limit Value (mg/Nm ³)
VOC	Cancer-causing, reproduction toxic or mutagen compounds	10	2
	Alogenated	100	20

Figure 1. IPPC Permits situation at the beginning of year 2013

trying to optimize the analyzed processes and to reduce their emissions limits.

The complete IPPC Permits release procedure is shown in the following Figure 2 (Battistella, 2013).

In Italy, since its start in 2009, this procedure allowed the results shown in the following figures for abatement of main environmental pollutants (air emissions) and at December 2014, every IPPC Plant have been licensed with IPPC Permits, in terms of first release, concluding authorization procedures (ISPRA, 2015).

1. *For 16 Italian Refineries*, the result in pollution abatement for macro pollutants, such as SO_x, NO_x, CO and PTS, is showed in Figure 3.
2. *For 46 Italian Chemical Plants*, the result in pollution abatement for macro pollutants, such as SO_x, NO_x, CO and PTS, is showed in Figure 4.

BAT Conclusions Application in IPPC Permitted Plants

In Italy, recent regulatory innovations introduced by Legislative Decree n. 46/2014—adopting in Italy

the European Commission ‘Industrial Emissions Directive’ - led to the imposition, during operation of IPPC installations as specified in AIA Permits, of further specific indications/prescriptions as defined in new BAT for each IPPC sector, with revised emission limit values for pollutants released into the environment, as reported in “BAT Conclusions” of new reviewed BRefs (Battistella, Di Marco, Bonaiuti, Carlucci, 2014).

This new approach applies to all IPPC installations subject to AIA Permits (first release) at national level, for which new legislation requires a review and an updating of existing authorizations, through new procedural “review/renewal” mechanisms, now closely linked to the adoption of new technologies as identified and published into new Brefs documents as ‘BAT Conclusions’ (Battistella et al., 2014).

In numerous ‘vertical’ BRefs, or rather specific Reference Documents for each type of production plants, end-of-pipe gas treatments are considered as a BAT for VOC and inorganic compounds abatement.

Almost all of these documents send back to ‘horizontal’ *Reference Document on Best Available Techniques in Common Waste Water and*

Figure 2. IPPC Permits release procedure

Figure 3. Pollution abatement for macro pollutants in Italian refineries

Figure 4. Pollution abatement for macro pollutants in Italian chemical plants

Waste Gas Treatment / Management Systems in the Chemical Sector - February 2003, for achievable emission limits and operative conditions of end of pipe devices.

Design standards are strictly related to properties of gas flow that define operative conditions, achievable performance and cross-media effects.

In Table 3 are described operative conditions and performance and emission levels achievable by implementation of BAT.

The following figures show the state-of-the-art of BAT application for waste-gas cleaning in

Italian AIA IPPC plants (Chemical plants and Refineries)³.

Going towards a complete BAT application for waste-gas cleaning operations, Italian AIA IPPC chemical plants and Refineries actually apply mainly Absorption and Adsorption techniques (respectively 54% and 30% of total AIA IPPC Chemical plants and Refineries adopting BAT⁴ as shown in Figure 5).

Absorption devices are mostly installed in IPPC Chemical Plants due to the properties of emitted pollutants (mainly inorganic ones), whereas Ad-

Table 3. Operative conditions and performance and emission levels achievable by implementation of BAT

Description ²	Thermal oxidation	Catalytic oxidation	Wet scrubbing (Absorption)	Adsorption
	Oxidation with oxygen (air) by heating a gas above its auto-ignition point	Oxidation with oxygen (air) using catalyst to lower auto-ignition point	Mass transfer from gaseous phase into liquid phase	Mass transfer from gaseous phase to solid surface
Application	Emissions from all VOC sources most suitable for autothermal VOC concentrations and final treatment for hazardous substances	Same application as thermal incineration, contaminants restricted to non-poisonous ones. It can be with or without heat recovery	Control of VOC, inorganic compounds and also of dust, depending on variant and scrubbing liquid (water, acidic and alkaline solution). By desorption it's also possible recovery of substances.	Removal of VOC, odorous substances, dioxins, mercury After regeneration it's also possible recovery of substances.
Cross-media effects	CO and NO _x in flue gas Cl- and S-content require flue gas treatment Dioxins can represent a problem if not operated at optimized conditions	Very low NO _x content in flue gas (about 15 mg/Nm ³) Cl- and S- content require flue gas treatment Dioxins are usually not a problem	Waste water to be treated Energy consumption and emissions during regeneration	Waste water generated during regeneration Disposal of adsorbent
Achievable performance [% pollutant removal]	VOC 95-99	VOC 90-99 CO >98 Odour 80-95	VOC 50-99 Inorganic compounds 90-99 SO ₂ 80-99	VOC 80-95 Odour 80-95 H ₂ S 80-95
Achievable emission levels [mg/Nm ³]	TOC 1-4	-	HF <1 HCl <10 (<50 with water) SO ₂ < 40	Hg < 0,05 Dioxins <0,1 ng/ Nm ³ TEQ

Figure 5. IPPC Chemical plants and Refineries installing abatement devices

sorption technique is mostly adopted in Refineries because of the mainly presence of organic emitted pollutants (see Figure 6).

Following graphics (see Figures 7, 8, 9, 10) represent operating data concerning waste gas end-of-pipe treatment techniques as run in licensed Italian Chemical plants and Refineries⁵ in order to represent operative conditions and emissions

scenarios related with application of BAT in Italian IPPC Plants.

The upper value for each board of graphics represent the *maximum IPPC Permits limit values* for each IPPC Category of activities.

The graphics well represents that VOC (as organic volatile compounds or equivalent carbon) are the widespread pollutants and the choice of

Figure 6. Percentage of Italian IPPC plants using 'sorbents technologies'

Figure 7. Operating emission data from thermal oxidizers in IPPC permitted plants

Figure 8. Operating emission data from catalytic oxidizers in IPPC permitted plants

Figure 9. Operating emission data from wet scrubbing devices in IPPC permitted plants

Figure 10. Operating emission data from adsorption devices in IPPC permitted plants

treatment device is strictly connected with the amount of pollutants fed in it.

In the following tables (see Tables 4, 5, 6, 7) are described operating data in 'first' AIA permits partitioned for each IPPC activity: in some cases AIA permit emission limit values are described as a range, in order to represent different limit values within these ranges fixed for different plants.

FUTURE RESEARCH DIRECTIONS

Recent regulatory innovations introduced by Italian Legislative Decree n. 46/2014 ^[9] led to the imposition, during operation of IPPC installations as specified in AIA Permits, of further specific indications as defined in new BAT for each IPPC sector, with revised emission limit values for pollutant released into the environment, as reported in "BAT Conclusions" of new reviewed BRefs.

This new approach applies to all IPPC installations subject to AIA Permits (first released) at national level, for which the new legislation requires an updating of existing authorizations, through new procedural "review/renewal" mechanisms, now closely linked to the identification of new technologies and the publication of BAT Conclusions.

In such a way, a second phase of IPPC permits is starting, after the expiring first phase, taking into account 'BAT Conclusions' issued in sectorial BRefs updating and upgraded and also other environmental aspects, as for example renewed attention towards territory inside which IPPC installations stands, based on a new evaluation of site conditions in terms of production/release of relevant hazardous substances, possibility of soil and groundwater contamination, soil vulnerabilities and all available operational data coming from annual reporting.

Table 4. AIA permits emission limits range for thermal oxidizers in IPPC permitted plants

THERMAL OXIDATION OPERATING DATA IN AIA PERMITS		
IPPC ACTIVITIES	Pollutants	AIA Permits Emission Limits Range (mg/Nm ³)
4.1 Production of organic chemicals + 4.2 Production of inorganic chemicals	SOx	150
	NOx	150
	CO	100
	VOC	4
	HCl	10
	PCDD/PCDF (as TEQ)	0,1
	PHA	0,1
	PCB (as TEQ)	0,1
	Dust	15
2.5.a Production of non-ferrous crude metals from ore, concentrates or secondary raw materials by metallurgical, chemical or electrolytic processes + 4.2 Production of inorganic chemicals	SOx	50
	NOx	100
	TOC	20
	Dust	5
	Pb	3,5
	Cd	0,2
	Benzene	5
	PCDD/PCDF	0,0005
	PHA	0,1
	HF	5
	HCl	30
4.1 Production of organic chemicals	NOx	10 - 240
	VOC	1-30
	CO	20 - 120
	Dust	10
	TOC	50
	Benzene	1
	PCDD/PCDF (come teq)	0,1 ng/Nm ³
	Chlorine	1
	CVM + DCE	0,2 ppm v/v
	HCl	10

For IPPC installations permitted at national level, these new regulations are going to finalize already existing IPPC permits by means of a ‘review and renew’ mechanism, giving also new opportunities for research, and focused mainly on these new aspects:

1. More tight respect – by now mandatory – towards the application of new technologies, to reach new and more stringent limit values, as well as synthetically defined inside ‘BAT Conclusions’ inside new revised BRefs;
2. Greater attention – to be verified from time to time – towards territorial environmental

Table 5. AIA permits emission limits range for catalytic oxidizers in IPPC permitted plants

aspects, up to now considered only marginally, as managed only inside the respect of the specific applicable standard;

3. A precise reconsideration of the implementation of adequate control and monitoring systems inside IPPC operating installations, finalized also to validate planned controls.

On account of the advantages reachable with a large use of these abatement devices, it's desirable a faster and faster development in application and correct use to achieve BAT performance and emission levels as soon as possible in a more wide part of IPPC plants.

Considering Italian Regulations, it can be suitable the definition of a specific contest for

these kind of devices due to their advantages and peculiarity.

CONCLUSION

The release of IPPC operational permits has given place to hundreds of different scenarios of best available techniques (BAT) implementation in these industrial sites, where environmental pollution is going now under a planned control in order:

1. To enforce BAT application and implementation inside new and already existing IPPC Plants;

2. To strengthen IPPC Permits via harmonization of integrated management of air, water and soil pollutants emissions an emissions to avoid different approaches towards pollution impacts management could allow pollution transfers from one environmental matrix to another.
3. To perform a properly planned and adequate monitoring and data reporting activities and, if needed, also periodic inspections based on the effective environmental risk found.

BAT application, in waste gas cleaning operations, is normally adopted in Italian IPPC chemical plants and Refineries, nevertheless mainly *Absorption systems and Adsorption systems are widely used, as well as respectively 54% and 30% of total Italian IPPC Chemical plants and Refineries* are installing these types of devices:

1. *Absorption devices* are mostly installed in Italian IPPC Chemical Plants (74% absorption vs 29% adsorption);
2. *Adsorption techniques* are mostly adopted in Refineries (31% adsorption vs 13% absorption) due to peculiarity of pollutants emitted (mainly inorganic ones in Chemical plants and organic ones in Refineries).

Considering all installed devices:

1. Absorption devices (such as wet scrubbers) are most diffused with an incident percent-

age of 55,9% relative to total number of devices installed and they are mainly used for abatement of inorganic substances (see Figure 11).

2. *Adsorption and Absorption devices* are still mostly diffused for abatement of VOC, respectively 43.28% and 31.34% of total devices analyzed in this work (see Figure 12).

For these devices operative management is relatively simple and cross media effects are at minimum compared with Thermal and Catalytic Oxidation devices (Battistella et al., 2014).

A correct use and management of waste gas cleaning devices can bring:

- An abatement of organic substances (cancer causing ones too), generally coming from vents, storage tanks and handling of liquid substances containing VOC, with a high efficiency of VOC removal and recovery in case of adsorption devices;
- A strong reduction of inorganic pollutants in the emissions from production processes with simple maintenance and minimum cross media effects (in case of Adsorption and Absorption);
- The recovery of combustion heat and generation of steam (in case of Thermal Oxidation);

Figure 11. Percentage of installed 'end of pipes abatement devices'

Figure 12. Percentage of installed 'end of pipes devices' for abatement of VOC

- A high thermal efficiency using recuperative and regenerative oxidation (in case of Thermal and Catalytic Oxidation).

KEY TERMS AND DEFINITIONS

Absorption: Mass transfer between a soluble gas and a solvent – often water – in contact with each other.

Adsorption: Heterogeneous reaction in which gas molecules are retained on a solid surface (adsorbent) that prefers specific compounds to others and thus removes them from effluent streams.

AIA: (Italian IPPC Permit): Operating permit released for environmental protection purposes, in order to prevent and control pollution.

BAT: Best Available Technologies.

BREF: Reference Document on Best Available Technologies.

Catalytic Oxidation: Oxidation process of combustible gases and odorants in a waste gas stream, by heating a mixture of contaminants with air or oxygen above its auto-ignition point. The gas, after passing through the flame area, passes through a catalyst bed. The catalyst has the effect of increasing the oxidation reaction rate, enabling conversion at lower reaction temperatures than in thermal oxidation units.

IMELS: Italian Minister of Environment, Land and Sea.

IPPC: Integrated Pollution Prevent and Control.

ISPRa: Superior Environmental Protection and Research Institute.

PTS: Total Suspended Particulate, the atmospheric particulate matter.

Thermal Oxidation: Oxidation process of combustible gases and odorants in a waste gas stream, by heating a mixture of contaminants with air or oxygen above its auto-ignition point in a furnace and maintaining it at high temperature for sufficient time to complete combustion to carbon dioxide and water.

TOC: Total Organic Carbon, the amount of carbon found in an organic compound.

VOC: Volatile Organic Compound, organic chemicals that have a high vapor pressure at ordinary room temperature. Their high vapor pressure results from a low boiling point, which causes large numbers of molecules to evaporate from the liquid form.

Ethics and Social Responsibility

The Foundation of (Business) Ethics' Evolution

E

Ben Tran

Alliant International University, USA

INTRODUCTION

Business education and higher education, according to Brink and Smith (2012), is general face criticism on several fronts and are subject to increasing scrutiny. Pringle and Michel (2007, p. 202) advised that “state legislators, parents, taxpayers, and donors want universities to justify their investments by providing evidence of student learning”. This justification seems warranted given Arum and Roksa’s (2011) compelling evidence demonstrating that undergraduate students are learning little, partly, because of the lack of rigor at institutions of higher education. In addition, possessing an MBA degree and the mastery of MBA subject matter are uncorrelated with career success (Pfeffer & Fong, 2002). Business schools are at a crossroads and it is time to seriously rethink or redesign business education (Datar, Garvin, & Cullen, 2010). The *Wall Street Journal* reported that corporate recruiters are questioning the value of the undergraduate business degree and “they’re looking for candidates with a broader academic background” (Korn, 2012). The purpose of this chapter is to cover the foundation of (business) ethics and the meaning of business ethics. In so doing, this chapter will cover the topic of accreditation in higher educational institutions, and the teaching of business ethics courses in higher educational institutions.

FOUNDATION OF BUSINESS EDUCATION AND ACCREDITATION IN HIGHER EDUCATION INSTITUTIONS

In light of criticisms regarding business education in higher education institutions, it would be prudent for business schools to assure their stakeholders of quality and accountability. Accreditation is one method of holding a program or institution accountable and demonstrating that the program/institution meets at least a minimum quality threshold. The Council for Higher Education Accreditation (CHEA) defines accreditation as “a process of external quality reviewer created and used by higher education to scrutinize colleges, universities and programs for quality assurance and quality improvement” (Eaton, 2011, p. 1). Accreditation serves several roles, two of which include “assuring quality and “engendering private sector confidence” (Eaton, 2011, p. 2-3). CHEA indicates that “accreditation in the United States is about quality assurance and quality improvement. It is a process to scrutinize higher education institutions and programs” (Eaton, 2011, p. 11).

The goal of CHEA is to assure “that accrediting organizations contribute to maintaining and improving academic quality” (Eaton, 2011, p. 9). CHEA’s role is to review and scrutinize the quality and effectiveness of accreditors and *recognize*

them. CHEA does not accredit institutions or programs, rather, CHEA accredits that accreditors. CHEA recognizes sixty institutional and programmatic accrediting organizations, including three [levels (gold, silver, and bronze)] that accredit business programs: the Association to Advance Collegiate Schools of Business (AACSB) International, the Accreditation Council for Business Schools and Programs (ACBSP), and the International Assembly for Collegiate Business Education (IACBE). Hence, a higher educational institution receiving regional accreditation does not necessarily translate to the same higher educational institution receiving one of the three levels of accreditation for its business program.

Currently, there are six regional accrediting agencies for educational institutions in the United States:

1. Middle States Association of Colleges and Schools [(Middle States Association, MSACS, or MSA) which covers educational institutions in New York, New Jersey, Pennsylvania, Delaware, Maryland, the District of Columbia, Puerto Rico, and the US Virgin Islands, as well as schools for American children in Europe, North Africa, and the Middle East),
2. New England Association of Schools and Colleges, Inc. [(NEASC) which covers educational institutions in the six New England states (Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont)],
3. Higher Learning Commission (formerly part of the North Central Association of Colleges and Schools and covers educational institutions in Arkansas, Arizona, Colorado, Iowa, Illinois, Indiana, Kansas, Michigan, Minnesota, Missouri, North Dakota, Nebraska, New Mexico, Ohio, Oklahoma, South Dakota, Wisconsin, West Virginia, and Wyoming),
4. Northwest Accreditation Commission (NWAC), formerly known as the Northwest

Association of Accredited Schools, is for primary and secondary schools and Northwest Commission on Colleges and Universities (NWCCU) for postsecondary institutions in Alaska, Idaho, Montana, Nevada, Oregon, Utah, and Washington,

5. Southern Association of Colleges and Schools [(SACS) which covers educational institutions in Alabama, Florida, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee, Texas and Virginia], and
6. Western Association of Schools and Colleges [(WASC) which covers educational institutions in California, Hawaii, Guam, American Samoa, Micronesia, Palau, and Northern Marianas Islands, as well as schools for American children in Asia].

Attaining and maintaining accreditation may help a business program distinguish itself based on quality. However, accreditation requires a substantial financial investment. Roberts, Johnson, and Groesbeck (2004, p. 112) indicated that “the annual incremental cost increase for even a small school...and can easily exceed \$500,000”.

Standards of Business Ethics

Among the three levels (bronze, silver, and gold) that accredit business programs (AACSB, ACBSP, and IACBE), only two levels are international accreditation bodies for higher education business schools, the AACSB and the ACBSP (Franks & Spalding, 2013). Both AACSB and ACBSP require business schools to incorporate ethics into their curricula, but between these two levels of accreditation, the standards put forth by the AACSB are more detailed than those put forth by the ACBSP. Under the AACSB approach, ethics education is required as part of the general knowledge and skills portion of the standards for undergraduates, and in the management-specific portion of the standards for undergraduate and master's students. Ethics education under this

regime involves four subject areas: (1) responsibility of business and society, (2) ethical leadership, (3) ethical corporate governance, and (4) ethical decision-making ([Association to Advance Collegiate Schools of Business (AACSB, 2004). Under the ACBSP approach, ethical issues are expected to be addressed within several contexts. For example, business ethics is considered to be part of a member school's education in regard to the impact of business on society. In addition, the standards require that ethical awareness and global awareness be included in the student skills that are assessed by member schools. Business ethics is also included as part of the common professional component of a typical business school curriculum [Association of Collegiate Business Schools and Program (ACBSP, 2011)].

Despite these accreditation requirements, the content of business ethics is not specifically defined or circumscribed by either of the major business school accreditation bodies. In their glossary section, for example, the ACBSP provides a definition of ethical behavior that refers to how organization insures that all its decision, actions and stakeholder interactions confirmed to the organization's moral and professional principals. Even though the ACBSP standards acknowledge that an organization's "moral principles" define right and wrong, the standards do not require instruction in moral theory *per se*, and the standards do not offer any guidance as to how those moral and professional principles are or ought to be derived [International, the Accreditation Council for Business Schools and Program (ACBSP, 2011, p. 62)]. Similarly, the AACSB standards suggest that students should be provided with the opportunity to learn and practice "multiple models for ethical decision making" as an important step in supporting their ability to make good personal choices and business decision in the future [Association to Advance Collegiate Schools of Business (AACSB, 2004, p. 18)]. As an assurance of learning guideline, the AACSB offers as possible learning goal the ability of students to "identify an ethical dilemma in a scenario case and apply an

ethics model of framework to propose and defend a resolution" (AACSB, 2007, p. 7).

The Accreditation of Business Education

All three business program accreditors, according to Brink and Smith (2012), are international in scope and, not surprisingly, the age of the accreditor is related to the number of programs it accredits. The AACSB is the oldest of the business school accreditors, founded in 1916 and is also the largest of the accreditors, the ACBSP was founded in 1988, and the IACBE is the newest of the accreditors, founded in 1997. The accreditation guidelines provided by all three accreditors are mission-based. The AACSB changed to mission-linked standards in 1991, whereas the ACBSP and IACBE were mission-based since inception. Many scholars have suggested that the emergence of the ACBSP as a competitor may have been partially responsible for AACSB's change to mission-linked standards (Lowrie & Willmott, 2009; McKenna, Cotton, & Van Auken, 1997; Ramey, 1993). The accreditation guidelines proffered by the three accreditors are similar with respect to the overall content and underlying principles. Juan and Ofori-Dankwa (2006) described several similarities in the mission focus of the three accreditors. Furthermore, Ramey (1993) suggested that ACBSP is a clone of AACSB and Lowrie and Willmott (2009, p. 412) stated that the mission linked approach of AACSB is "emulated by its national competitors, the ACBSP...and IACBE".

First, the accreditation guidelines of the ACBSP and IACBE, in particular, are very similar to one another, perhaps because both accrediting bodies were founded by the same person: Dr. John L. Green, Jr. (IACBE, 2011). Though the contents of the accreditors' guidelines are similar, the rigidity and rigor of the guidelines vary. Second, accreditors differ in the rigor of the faculty qualification requirements. The ACBSP's definition of *academically qualified* (AQ) faculty is similar to the IACBE's definition of *doctorally qualified*

(DQ) faculty, and they both have similar definitions of *professionally qualified* (PQ) faculty. However, the IACBE definitions could be considered less rigorous because they are *suggested principles* rather than *required standards*. The ACBSP and IACBE allow for a greater variety of pathways to becoming A/DQ and PQ compared to the AACSB. Therefore, the AACSB has the most rigorous, and the IACBE has the least rigorous definitions of A/DQ and PQ (Brink & Smith, 2012).

Third, the required percentages of qualified faculty vary. The AACSB, according to Brink and Smith (2012), requires at least 90% of the faculty to be AQ or PQ and 50% to be AQ. The ACBSP criteria vary by undergraduate and graduate programs. The ACBSP requires that at least 80% of undergraduate and 90% of graduate credit hours be taught by AQ or PQ faculty. Therefore, the ACBSP's requires that percentages for overall AQ and PQ faculty is less rigorous than the AACSB's. The ACBSP requires that at least 40% of undergraduate and 70% of graduate credit hours be taught by AQ faculty, and 100% of doctorate credit hours be taught by AQ faculty. The ACBSP faculty qualification standards regarding the percentage of AQ faculty required at the graduate level are more rigorous than the AACSB's standards. Overall, the AACSB has the most rigorous requirements regarding the necessary percentages of qualified faculty, and the IACBE has the least rigorous requirement, offering the principle that there should be at least one full-time DQ faculty for each program. Fourth, accreditors differ with respect to the rigor of research or scholarly activity requirements. The AACSB expects a significant portion of intellectual contributions to be peer-reviewed scholarship, whereas the ACBSP and IACBE are more open to other forms of scholarly activity. In fact, the ACBSP explicitly acknowledges that the AACSB is the premier accreditor for research-oriented programs (Brink & Smith, 2012). In addition, Roller, Andrews, and Bovee (2003) surveyed faculty from AACSB-, ACBSP-, and IACBE-accredited business programs and found that all three groups of faculty rated AACSB

the highest with respect to promoting excellence in research.

Meanings of Business Ethics

Business ethics is a form of applied ethics (Velentzas & Broni, 2010) that examines ethical principles and moral or ethical problems that arise in a business environment (Solomon, 1991). It applies to all aspects of business conduct (Baumhart, 1968; Ferrell, Fraedrich, 1977; Singer, 1991) and is relevant to the conduct of individuals and business organizations as a whole (Bernard, 1972; Donaldson, 1982, p. 36). Applied ethics is a field of ethics that deals with ethical questions in many fields such as technical, legal, business and medical ethics (Preston, 1997, p. 6-11). Business ethics consists of a set of moral principles and values (Jones, Parker, & Bos, 1005, p. 17) that govern the behavior of the organization with respect to what is right and what is wrong (Badiou, 2001; Seglin, 2003). It spells out the basic philosophy and priorities of an organization in concrete terms (French, 1979, 1995). It also contains the prohibitory actions at the workplace (Collier, Esteban, 1007, p. 19; Duska, 1999). It provides a framework on which the organization could be legally governed. With time, certain moral philosophies have helped in the evolution of four basic concepts of ethics. They are deontology, relativism, egoism, and utilitarianism (Velentzas & Broni, 2010). Business ethics is the behavior that a business adheres to in its daily dealings with the world (Borgerson & Schroeder, 2008).

The ethics of a particular business can be diverse (Solomon, 1983). They apply not only to how the business interacts with the world at large, but also to their one-on-one dealings with a single customer (Solomon, 1991). As such, if a company does not adhere to business ethics and breaks the laws, they usually end up being fined (Drucker, 1981). Many companies have broken anti-trust, ethical and environmental laws and received fines worth millions (Velasquez, 1983). The problem is that the amount of money these companies

are making outweighs the fines applied (Green, 1991). The profits blind the companies to their lack of business ethics, and the money sign wins (De George, 1999). Hence, in the increasingly conscience-focused marketplaces, the demand for more ethical business processes and actions, known as ethicism, is increasing (Donaldson, 1982, p. 32). Simultaneously, pressures is applied on industry to improve business ethics through new public initiatives and laws. Thus, business ethics can be both a normative and a descriptive discipline (Abrams, 1954). As a corporate practice and a career specialization, the field is primarily normative. In academic descriptive approaches are also taken. The range and quantity of business ethical issues reflects the degree to which business is perceived to be at odds with non-economic social values. Historically, interest in business ethics accelerated dramatically during the 1980s and 1990s, both within major corporations and within academia (Cory, 1005, p. 11).

The Historical Philosophy of Ethics

As a discrete, self-conscious academic discipline, business ethics is roughly four decades old (Velentzas & Broni, 2010). Richard DeGoerge (2005), on the other hand, dates academic business ethics to the 1970s, identifying Baumhart as a forerunner to a self-conscious academic business ethics. Raymond Baumhart's (1961, 1963, 1968) groundbreaking studies in the 1960s are generally understood to be early contributions to business ethics. Furthermore, prominent contemporary business ethicist Norman Bowie (1999, 2005) dates the field's first academic conference to 1974. Although academic instruction explicitly devoted to the relationship between ethics and commerce can be found in U.S. business schools as early as the first three decades of the 20th century, particularly in Catholic colleges and universities, creation of academic positions dedicated explicitly to business ethics in U.S. business schools tracks closely waves of corporate scandal from the 1980s to the present. Academic business ethicists address

questions that range across the functional areas of business, giving rise to various recognized specialties in business ethics. But despite the wide range of questions pursued, the bulk of the academic literature and discussion is focused more closely on the large corporation whose ownership shares are traded on public exchanges. In this broad sense, ethics in business is simply the application of everyday moral or ethical norms to business (Bennett, 2003; Boylan, 1995), and a philosophical paradigm shares a similar long tradition (Capaldi, 2006; Velentzas & Broni, 2010, pp. 45-56).

FUTURE RESEARCH DIRECTIONS

There is no doubt that business ethics is an important part of the higher education landscape, however, business ethics is a relatively contemporary subject. It was not officially recognized as an applied science until after an academic conference held at the University of Kansas in 1974. The subsequent development of the *Journal of Business Ethics and Business Ethics Quarterly* resulted (DeGeorge, 2005). "Recent years have seen exponential growth in the use of terms such as corporate social responsibility, sustainability, going green, sustainable development, social entrepreneurship, corporate ethics, the triple bottom line, as well as a variety of other terms that imply that businesses have obligations beyond the maximization of profit (AACSB International, N. D.). According to the Aspen Institute, an international non-profit organization dedicated to fostering values-based leadership, the percentage of MBA programs that require at least one ethics, sustainability, business and society or corporate social responsibility course has increased from 34% in 2001 to 54% in 2005 (Aspen Institute, 2005). Ethical missteps such as the savings and loan crises in the late 1980s and the accounting scandals marking the entrance to the 21st century have buttressed the need for instruction in business ethics both outside of the workplace and in higher education. Multiple authors, according to Hasnas

(2013), have cited instances in which courses in business ethics at university or business schools do not have profound transformative effects on student's attitudes about ethics (Wynd & Mager, 1989) or on perceptions of ethical behavior (Davis & Welton, 1991), or do these classes affect their future professional lives (Pamental, 1989). Kraft and Singhapakdi (1991) found that business ethics taught at the undergraduate or even at the graduate level were of little significance in an individuals' overall ethics training.

CONCLUSION

According to Duska (2013), Hasna (2013), and Koehn (2005), teaching ethics is always a challenge, because most students spend most of their time collecting facts and learning how the world works without truly understanding it. Through most of their education, students attain academic success by demonstrating the ability to understand or discover factual information and reproduce it on demand—to read, to remember, and to repeat. But ethics has no determinate body of facts to absorb and retain. Its focus is not on discovery but on evaluation. The skills it requires are the analytical ones of perceiving the relationships among assertions, recognizing inconsistencies, tracing implications, and judging the cogency of arguments—skills that a significant number of students have never developed. If this situation makes teaching ethics a challenge, then, teaching it in a business school is doubly so. Not only business students, but most business school faculty are completely unfamiliar with the techniques of ethical analysis (Duska, 2013; Hasna, 2013; Koehn, 2005). They are trained in quantificational methods and are often gifted empirical problem-solvers. They are skilled at determining the most effective means of attaining specified goals. But the conceptual tools needed to determine which goals are proper to pursue are entirely new to them. The lack of familiarity with the nature of ethical enquiry that is typical of business school students and faculty presents those charged with

teaching ethics in business schools with four major challenges (Hasnas, 2013): 1) the challenge of definition, 2) the challenge of abstraction, 3) the challenge of cultural relativism, and 4) the challenge of integration.

KEY TERMS AND DEFINITIONS

AACSB: The Association to Advance Collegiate Schools of Business.

Academic Business Ethicists: Address questions that range across the functional areas of business, giving rise to various recognized specialties in business ethics.

ACBSP: Association of Collegiate Business Schools and Program.

Accreditation: A process of external quality reviewer created and used by higher education to scrutinize colleges, universities and programs for quality assurance and quality improvement.

Business Ethics: A form of applied ethics that examines ethical principles and moral or ethical problems that arise in a business environment.

CHEA: Council for Higher Education Accreditation.

IACBE: International Assembly for Collegiate Business Education.

Higher Learning Commission: Formerly part of the North Central Association of Colleges and Schools and covers educational institutions in Arkansas, Arizona, Colorado, Iowa, Illinois, Indiana, Kansas, Michigan, Minnesota, Missouri, North Dakota, Nebraska, New Mexico, Ohio, Oklahoma, South Dakota, Wisconsin, West Virginia, and Wyoming.

Middle States Association of Colleges and Schools: Commonly known as Middle States Association, MSACS, or MSA, which covers educational institutions in New York, New Jersey, Pennsylvania, Delaware, Maryland, the District of Columbia, Puerto Rico, and the US Virgin Islands, as well as schools for American children in Europe, North Africa, and the Middle East.

New England Association of Schools and Colleges, Inc.: Also known by the abbreviation NEASC, covers educational institutions in the six New England states (Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont).

Northwest Accreditation Commission (NWAC): Formerly known as the Northwest Association of Accredited Schools, is for primary and secondary schools and Northwest Commission on Colleges and Universities (NWCCU) for postsecondary institutions in Alaska, Idaho, Montana, Nevada, Oregon, Utah, and Washington.

Southern Association of Colleges and Schools[(SACS): Covers educational institutions in Alabama, Florida, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee, Texas and Virginia.

WASC: Western Association of Schools and Colleges (WASC) covers educational institutions in California, Hawaii, Guam, American Samoa, Micronesia, Palau, and Northern Marianas Islands, as well as schools for American children in Asia.

Integrating Sustainability and CSR in the Value Chain of the Information Technology Sector

E

Patricia Martínez García de Leaniz
University of Cantabria, Spain

María Elena García Ruiz
University of Cantabria, Spain

INTRODUCTION

Actually, all industrial sectors are aware of the importance of sustainability in all its business actions by articulating corporate social responsibility (CSR) strategies. The CSR concept refers to the set of commitments that a company acquires to manage its economic, social and environmental impacts and to support the objective of maximizing profits while generating benefits for society, particularly for its stakeholders. Due to their negative impacts in the natural environment in the information technology (IT) sector the interest in CSR and sustainability is even greater (Carter & Rogers, 2008; Dao et al., 2011).

Many international initiatives show the growing importance of socially responsible and sustainable aspects in the IT sector. For instance, the International Telecommunications Union (UIT) is the United Nations specialized agency for ITs. One of the focal points of the UIT is IT, sustainability and climate change. The Global e-Sustainability initiative (GeSI) was born in order to promote sustainable development in the IT sector. This initiative promotes those technologies that allow sustainable development and it is dedicated exclusively to IT sustainability through innovation.

In today's rapidly changing market, IT companies are seeking greater performance, better features and more flexibility at the lowest price (Hervani et al., 2005). Despite the economic recession the IT sector is seeing exceptional

growth. According to CompTIA, the IT sector Trade Association, this sector generated 3.7 \$ trillion income in 2014 with growth rates of 5% for 2015. In this context, demand going forward will be determined by evolving views on perceived value and consumer tastes. In this regard, customers are demanding more out of IT firms that simply a quality product at a low price. The goal for IT companies is to compete on the market through offering distinguished sustainable products (McAfee & Brynjolfsson, 2008). IT companies should be able to create and develop new and innovative products while operating in a sustainable and responsible way. By implementing socially responsible initiatives, IT businesses can build sustainability into the operations and management. This study is aimed at exploring the importance of sustainability and corporate social responsibility in the IT sector.

BACKGROUND

Corporate Social Responsibility

An increasingly important aspect of corporate management in recent decades has been the incorporation of CSR, a construct that emphasizes the obligation of companies to integrate social and environmental parameters into their modus operandi and their long-term strategies. Although some publications present CSR as a new construct,

DOI: 10.4018/978-1-5225-2255-3.ch277

the idea that companies must manage their social and environmental obligations has its roots in a much older debate (Dejean and Gond, 2004). Extant literature in economic and organizational theory has reviewed the role of business in society, and all of them agree that the purpose of business should be broadened beyond only economic benefits (Friedman, 1970) and that a social dimension should be incorporated into corporate performance.

The CSR concept refers to the set of commitments that a company acquires to manage its economic, social and environmental impacts and to support the objective of maximizing profits while generating benefits for society, particularly for its stakeholders. However, one question may arise: What kind of actions can be considered as socially responsible? Depending on the business activity, the sector or country in which the company operates, the applicable law can change and, therefore, also the actions that may be considered as socially responsible. However, all CSR actions have as a starting point to meet the expectations of stakeholders minimizing the risks associated with their activity (other than financial) and “positivizing” the impacts of their activity in the economic, social and environmental sphere.

IT Sector

The IT sector has transformed the way people live, work and learn. From mobile phones and micro-computer chips to the Internet, IT has consistently delivered innovative products and services that are now an integral part of everyday life. Technological progress, infrastructure deployment, and falling prices have brought unexpected growth in IT access and connectivity to billions of people around the world. IT has systematically increased productivity and supported economic growth across both developed and developing countries (McAfee & Brynjolfsson, 2008). Globally 3.200 million people are using the Internet of which 2.000 million are from developing countries. By the end of 2015, there are expected more than 7.000 million mobile cellular subscriptions worldwide (less than 1.000 million in 2000). As shown in Figure 1, mobile broadband subscriptions is the most dynamic market segment with 12 times higher penetration than in 2007 (penetration rate 97%) in comparison with fixed-broadband (11% penetration expected in 2015) (ICT Facts & Figures, 2015).

Figure 1. Growth trend in the IT industry

IT Sector's Value Chain

Before delving into the key issues for a sustainable and responsible management in the IT sector we have to explore the agents involved in the value chain of this industry. As Porter explains (1985) a value chain is a set of activities that a firm operating in a specific industry performs in order to deliver a valuable product or service to the market. The IT value chain involves several agents and activities, from the creation and edition of the content to the service provision and final delivery to users. According to the European Commission (1997) the key players in the value chain of the IT sector are: Manufacturers and integrators of equipment and devices, content and applications developers, network operators, distributors and users. Figure 2 graphically shows the generic value chain that is established for the provision of IT services to end users.

- **Manufacturers and Integrators of Equipment and Devices:** These agents are designers and producers of IT hardware. It is possible to distinguish between manufacturers of equipment (modems, servers, routers, gateways and network interfaces) and handset manufacturers (terminals for transmitting and/or receiving information).
- **Content and Applications Developers:** These actors create the content and adapt it to compatible formats for applications according to user terminal devices. They also develop intermediary applications between the device and network hardware.

- **Network Operators:** They provide, operate and maintain the infrastructure that allows the circulation and transmission of information and content from the sender to the receiver in an effective and efficient manner.
- **Service Providers:** Originally, the provision of IT services was closely linked to the existence of a particular infrastructure or network. It is no longer the case and users can enjoy a wide variety of access services accessing their content provider regardless of their network operator.
- **Distributors:** They are responsible for the distribution and sale of terminal devices to end users. Often, service providers and device manufacturers themselves act as distributors of these devices, so in these cases it is not easy to identify these agents.
- **Users:** They are the final consumers of information services accessing these services through appropriate devices.

CSR ASPECTS IN THE IT VALUE CHAIN

Porter and Kramer (2006) suggest that the value chain of firms can be used to show how CSR can impact companies' strategy. It is essential to explore the structure of the IT value chain and its composition to make an analysis of the impacts and responsibilities of those agents involved. Table 1 summarizes some of the key CSR aspects to consider for each actor in the IT value chain for

Figure 2. Major players in the IT value chain

Source: Lemonche and de la Cuesta (2010)

Table 1. CSR aspects for each agent in the IT value chain

Critical Aspects According to CSR Criteria				
Agent	Service/Product	Economy	Society	Environment
Manufacturers and integrators of equipment and devices	Equipment and devices	Quality and reliability of equipment.	Life cycle of products. Delocalized production in developing countries.	Delocalized production in developing countries. Communication in emergencies.
Content and applications developers	Software products	Copyright vs free download. Proprietary software vs. open software.	-	User safety. Child protection. Accessibility.
Network operators	Connectivity services	Network reliability. Communications quality.	Logistics and removal of network equipment. Management equipment suppliers.	Scope of service in excluded areas (universal access).
Service providers	Access and value added services	Customer care.	-	Digital divide. IT literacy. Accessibility.
Distributors	Equipment and devices	Quality vs price.	Distribution logistics. Withdrawal of obsolete equipment.	User safety. Distribution in depressed areas.

Source: Lemonche and de la Cuesta (2010)

each CSR are described in the triple bottom line: economic, environmental and social.

Economic Aspects

Beyond maximizing business benefit associated with each actor in the IT value chain, it is necessary to take into account the specific aspects of their activity, their role in the sector and the needs and expectations of their stakeholders. Thus, a manufacturer or distributor of equipment and devices should pay attention to the quality and reliability of its products and the right quality/price ratio. If, on the contrary, it is a network operator the challenge will be to ensure its customers a high degree of reliability network (understood as the degree of service continuity or absence of cuts, signal degradation or incidents perceived by users). This can be expressed as “quality communication” with regard to both the end user and any other agent whose business depends on the network. In this sense, the greater the impact of a possible lack of communication in the business, the

higher must be the degree of network reliability, for which different levels of service quality and price are designed.

The software and content providers face the debate between the protection of intellectual property rights and the open provision of software and content via Internet to facilitate universal access to information. All actors in the IT value chain must responsibly manage their own value chain and provide good after-sales service.

Environmental Aspects

It is known that all business activities have environmental impacts and so it is in the IT sector (Vachon & Klassen, 2007). However, environmental management in IT firms is especially important for those actors who work directly with physical products (manufacturers, operators and distributors) compared to those other agents whose “products” are basically information and knowledge (content developers and service providers). The IT sector is based mainly on the production

and use of electronic equipment, from the largest infrastructure (telephone exchanges, network data servers or satellite communication stations) to the smallest mobile phone.

Therefore, the responsible and sustainable management of the life cycle of these equipments is key to the proper environmental management in the IT industry (Jørgensen, T.H., 2008). The R+D+I of IT firms seek to develop equipment and devices that achieve maximum energy efficiency with minimum consumption of materials and optimal recovery cycle. In this sense, the environmental responsibility of manufacturers or producers is high and so it is recognized in several legislative initiatives. Environmental responsibility of network operators and distributors will be to maintain the ideal life cycle of these products, selecting less polluting equipment and more responsible suppliers, optimizing energy consumption and contributing to successful recovery of products at the end of their useful life.

The delocalized production in developing countries (mainly Asian) and international supply chains of IT equipments must always maintain high standards of environmental management beyond borders and local laws (Zhu et al., 2005).

Social Aspects

Social issues of the IT value chain are perhaps where it is possible to find the greatest number of synergies among the different actors and at the same time where each of them can provide a more differentiated value. There are indisputable common goals, such as those aimed at defending human rights in the global supply chain, improving the accessibility to information services and combating the digital divide, among others. In addition, public commitments such as declarations of principles or codes of conduct must be accompanied by control and verifications to ensure a real responsible management of these aspects.

The responsibility of IT companies is evident not only in the adequate supply of equipment and provision of IT services to those who can use them,

but also keeping the focus on those individuals and communities that do not have access to ITs and therefore see their quality of life very limited. Each IT agent can provide here their own solutions for the provision of equipments and communication systems in emergency solutions, the extension of communication networks in depressed areas or the research on accessibility solutions.

Finally, we cannot forget that while ITs can greatly benefit individuals they also have some risks related to misuse or abuse that are important to consider. Beyond the necessary security guarantees for the health and safety of users, it is essential for IT actors to manage with prudence the effects of information and communication services in especially sensitive groups such as children. IT actors directly involved in the provision of these services must exercise their responsibility, always keeping in mind their business strategies to their potential users and providing the best controls against abuse, supporting parents and educators in their educational role and always protecting those most in need.

CSR TOOLS FOR IT BUSINESSES

In this section we will deepen into the responsibility of IT firms and the available mechanisms for them to exercise this responsibility. It is necessary to bear in mind that the IT sector differs from other industries in that, in addition to the direct impacts (economic, social and environmental) this sector may affect the impact of other sectors. To explore these issues, we will base our arguments on the impacts classification provided by Lemonche and de la Cuesta (2010). According to these authors, the IT industry has three pathways to impact on economy, society and environment:

- *Direct Impacts* that an IT company has in the development of its activity, including the social and economic impacts on its stakeholders and throughout its value chain.

- *Enablers Impacts*, since the application of technology allows companies in other sectors improve their social and environmental impacts.
- *Systemic Impacts* on global social issues such as inclusion, inequality or access to information.

Thus, we conclude that IT companies have two ways to approach their CSR strategy:

- Practicing their CSR as a company measuring the impacts of their activity.
- Promoting a social and responsible use of their products. That is, promoting the role of the IT sector itself as an engine for social change.

This is the big difference between the IT industry and other business sectors: the possibility of having two different ways to face the challenge of CSR and sustainability. The first course of action is based on using the common goals of companies to improve their responsible management. The second one consists on promoting the responsibility of the IT sector, developing technological improvements in other social areas such as education or health. Below we present some of the CSR approaches considering social, environmental and economic impacts of ITs.

We delve into the systemic impacts of ITs through their effects on other social areas. As a transversal element of all these synergies are green ITs (Sabbaghi and Vaidyanathan, 2012). Among the green IT applications which are more attractive to promote systemic changes we emphasize the dematerialization, virtualization and cloud computing models. These are applications that provide direct and enabling effects but at the same time present a significant potential for changing habits of energy consumption, which forms the basis for the aforementioned systemic effects. Some of the points where IT companies can positively influence to a greater extent are:

- **Health:** The World Health Organization (WHO) recognizes the potential of ITs to achieve more effective health services and improve access to health care. In this regard, the WHO emphasizes the crucial role that technology can provide to the management and access to health services in the provision of health care, health education and communication.
- **Digital Inclusion:** The Digital Agenda for some countries (2013) has established a plan for digital inclusion and employability as a result of contributions of multiple stakeholders (public and private) coordinated with the common goal of improving the quality of life of citizenship and enhancing the competitiveness and positioning of small and medium size companies through the use of ITs.
- **Education:** The emerging “information society” with the globalization context in which we live today exert a great influence, clearly and directly, in the world of education and learning. Within this social scenario, ITs play a key role for the following reasons. First, educational institutions have been subjected to a process of updating in light of new social expectations. Subsequently, they have had to implement new methodological and pedagogical techniques in accordance to the integrated use of new technologies. Secondly, ITs are tools that enable new mechanisms for knowledge transfer.
- **Transparency and Good Governance:** Transparency and participatory democracy are constituent factors of good governance whether in the public, private or institutional setting. The term “good governance” involves new forms of participation of civil society. One of these new ways of civic participation is access to information and thereby proclaiming the right to transparency. ITs are vital to enable all these emerging principles and rights.

- **Sustainability:** According to the “2020 SMART” report (2008), the IT sector is vital in the fight against the climate change, which could allow the reduction of CO2 emissions in 7.8 GT by 2020. This reduction would come from the incorporation of technological improvements in those sectors with the greatest environmental impact. The IT industry has, for instance, the ability to reduce the need to transport people and goods and to optimize energy consumption in lighting systems or factories or buildings.
- **Development Cooperation:** Within the United Nations “Millennium Declaration” is included the specific goal to develop a global partnership (in cooperation with the private sector) to ensure the benefits of new technologies, especially information and communication technologies. This demonstrates the commitment to boost new methodologies as a means to improve the quality of the initiatives in development cooperation.

CSR Management in Delocalized Production

All companies make purchases and not all of them have the same risks. We must remember two of the premises of CSR: that is voluntary and goes beyond legislation. To choose which types of initiatives could be implemented companies must first analyze the following points: (1) The ability to influence the behavior of suppliers and (2) the risks associate with the countries providing the purchases (in terms of environmental protection, corruption or human rights for instance. To minimize the risks associated with purchasing materials outside our borders, we will highlight simple actions that do not require great investment.

A useful starting point could be the elaboration of codes of conduct, codes of purchased or supplier codes which specify the conditions that our suppliers have to meet. As an example IT firms can

ask suppliers if they meet the recommendations of the ILO on child or forced labor. Similarly, firms can request that purchased materials meet some specific certification that verifies the behaviors of suppliers. Firms can also require certifications in some CSR domain such as employees’ working conditions or environmental performance, among others. There is also the possibility of adopting international standards as enforceable and exclusive criteria that suppliers should fulfill, certifiable standards in environmental legislation or socially responsible certified management systems. Some of the most widespread certifiable CSR standards are:

- **SGE21: 2008:** It is the first CSR management system that allows audit processes and achieves a certification in ethical and socially responsible management. This certificate is based on consolidated models such as those related to quality or environmental aspects, but enriching them through a multi-stakeholder vision.
- **Social Accountability SA8000:** Social Accountability International (SAI) is an international non-profit (multi-stakeholder) organization dedicated to developing and implementing socially responsible standards to improve working conditions. It is recognized worldwide and is one of the most prestigious certifications in labor rights.

Internal Management of CSR

Internal CSR affects the management of people within the organization (Dao et al., 2011). It is something that goes beyond human resources management, since the impact of the activity on the lives of employees is part of the social dimension of CSR. IT firms can improve the performance of the company on internal CSR by implementing plans for equal opportunities for male and female workers, designing plans to integrate people at risk of exclusion within the company or promoting

corporate volunteering among employees (giving business hours to collaborate in a local project for instance) (Wirtenberg et al., 2007). In this sense, Colbert and Kurucz (2007) argue that by linking human resources principles to companies' CSR objectives, firms can create lasting industry advantage and build capabilities for positive change.

Environmental Management

Some tools to measure environmental impact are the following international standards that may be interesting for IT firms:

- **ISO/TS 14067: 2013:** Greenhouse gases and carbon footprint of products: It establishes principles, requirements and guidelines for the quantification and communication of carbon footprints on the basis of the emission and removal of greenhouse gases during the life cycle a product.
- **ISO 14046:** Environmental management – Water footprint: This standard establishes the principles, requirements and guidelines for a correct evaluation of the water footprint of products, processes and organizations, from the analysis of their life cycle.

In addition, the IT sector has specific tools to manage their environmental impacts. We highlight the “Toolkit on environmental sustainability in the ICT sector”¹¹. This is an initiative of the ITU that provides comprehensive and detailed information for IT companies on how to achieve sustainability in their operations and management of the organization, through the practical application of international standards and guidelines.

CSR and Reporting

CSR and sustainability reports have been strengthening as a communication tool in the IT sector as evidence of the commitment of this sector to

sustainable development. We detail below the main characteristics that a CSR report must present:

- **Transparency:** It should include both positive and negative information and honesty about the compliance of objectives.
- **Materiality:** The information contained in the report should cover those aspects and indicators that reflect social, environmental and economic significant impacts of the organization.
- **Customization:** The CSR strategy of each IT company should be “unique” as its sustainability report.
- **Performance Indicators:** IT companies have to choose the most appropriate indicators to reflect what they want to communicate. Performance indicators give firms a baseline from which they can make a comparison between planned targets and performance achieved.

FUTURE RESEARCH DIRECTIONS

The authors of this chapter hope that this research will prove to both scholars and practitioners the value of CSR initiatives for the IT industry. Future studies could explore the implementation of these initiatives in each of the key agents forming the value chain of the IT sector (from manufactures and integrators of equipment and devices to network operators and distributors) in order to identify best practices and develop effective strategies of benchmarking. Therefore, enablers and obstacles could be identified in order to put into practice CSR activities.

CONCLUSION

Value chain is increasingly recognized as a key component of corporate responsibility. Managing

the social, environmental and economic impacts of supply chains makes good business sense as well as being the right thing to do. However, the IT value chain consists of continuously evolving markets and relationships. In this chapter, the authors offer practical steps that IT companies can take as the basis to introduce sustainability and CSR aspects into their value chain.

There are numerous reasons why IT companies are willing to introduce sustainability in their value chains. Primary among them it is to ensure compliance with laws and regulations and to adhere to and support international principles for sustainable business conduct. In addition, IT companies are increasingly taking actions that result in better social, economic and environmental impacts because society expects this and because there are business benefits to doing so. By managing and seeking to improve environmental, social and economic performance and good governance throughout value chains, IT companies act in their own interest the interests of stakeholders and the interest of society at large.

In this chapter the authors have explored CSR tools available to the IT sector, taking into account that there are three ways to influence the economy, society and environment distinguishing between direct, enables and systemic impacts. Through these actions and considering these impacts, IT companies can have positive influences on health, digital inclusion, education and transparency, among others. Therefore, the authors highly recommend that IT firms should pay special attention to various fundamental aspects such as their delocalization policies, internal CSR management, environmental management and communication, with the ultimate goal of capturing all their CSR strategy in the sustainability report that ought to contain references, among others, to transparency, customization and performance indicators.

KEY TERMS AND DEFINITIONS

Corporate Social Responsibility: It is about how companies manage the business processes to produce an overall positive impact on society. This concept goes beyond compliance and engages in actions that appear to further some social good, beyond the interests of the firm and that which is required by law (e.g., waste and pollution reduction processes, educational and social programs...).

Information Technology: It is the application of telecommunications equipment to store, retrieve, transmit and manipulate data in the context of a business.

Sustainability: It is a concept that describes a human development aims at satisfying present needs without compromising the capacity of future generations to satisfy their own needs.

Value Chain: It is a set of activities that a firm operating in a specific industry or sector performs in order to deliver a valuable product or service for the market. The IT value chain involves several agents and activities, from the creation and edition of the content to the service provision and final delivery to users.

The Morality of Reporting Safety Concerns in Aviation

Kawtar Tani

UCOL, New Zealand

INTRODUCTION

Previous investigation into the morality of actions suggested that individuals' level of cognitive moral development, strongly influences their decisions regarding what is right or wrong, and focuses upon the rights, duties and obligations involved in a particular ethical situation. Using the cognitive moral development framework, this research sought to explore the moral reasoning behind aviation employees' intentions to report wrongdoing in the aviation context. Specifically, looking at whether an association between participants' intentions to intervene in a wrongdoing situation, and their level of moral reasoning exists. This research covers one of the important issues that affect safety management in organisations, and provides opportunities on how it can be improved.

BACKGROUND

The role of employees in the prevention and detection of wrongdoing within organisations has been widely acknowledged (Camerer, 2001; Sawyer, 2005; KMPG, 2008). Up to 80% of incidents are believed to be unreported within organisations (NZALPA, 2005). It can be argued that by reporting wrongdoing, employees could provide information that can be used proactively by organisations to improve safety practice at the workplace. However, viewpoints about reporting vary considerably. Individual values, corporate values, cultural environment and personal benefits are but some of the few elements that decide whether the action of reporting is an important source of

information (Kohn & Kohn, 1988), or whether it is a disloyal act deserving punishment (Lewis, 2001). Whatever la raison d'être of reporting may be, it can be argued that reporters of wrongdoing are highly devoted to their cause, determined to defeat silence and act in a way that they perceive right. Such individuals find themselves balancing conflicting loyalties, obligations and values none of which are right or wrong (Dehn, 1999). There is a conflict between the right to privacy and the right to know; employer and colleagues' loyalty vis à vis the good citizen's duty to uphold the law; and the conflict between individualism and being a team player (Camerer, 2001). Set against these imperatives is the fear of being disloyal and losing the trust of the employer and colleagues, the fear of being wrong, and the fear of accepting responsibility for one's actions and their resulting consequences (Dehn, 1999).

MAIN FOCUS OF THE STUDY

There are two frameworks within which under-reporting of aviation wrongdoing could be explored: a moral framework, and an evolutionary framework. The moral framework assumes that the person witnessing wrongdoing does what they believe to be the 'right thing', within the limits of their understanding of right and wrong. In other words, participants' responses could be related to their level of moral development. Kohlberg's (1976) and Gilligan's (1982) cognitive moral development theories are two prominent theories which propose that individuals' progress in stages of moral reasoning and tend to operate at

a particular stage at any point in time. Kohlberg's cognitive stages of moral development propose that an individual's level of cognitive moral development strongly influences their decision regarding what is right or wrong and focuses upon the rights, duties and obligations involved in a particular ethical situation. Contrarily, Gilligan defines ethical issues mainly in terms of helping others and minimising harm and argues that moral behaviour results from meeting one's obligations and responsibilities to others.

As the level of people's moral judgment can be raised by education (Kohlberg, 1984; Oderman, 2002; Peters, 2015), the first aim of this study was to investigate aviation employees' level of moral reasoning when confronted with wrongdoing situations. If a relationship between reporting intentions and moral development is suggested, then ethics education may be one means by which under-reporting in aviation can be reduced. The following hypothesis was therefore proposed:

Hypothesis 1: Aviation employees indicating they would intervene upon becoming aware of aviation wrongdoing operate at a higher level of moral development than aviation employees who would not intervene in a wrongdoing situation.

The evolutionary framework in which to further explore under-reporting of aviation wrongdoing is that of inclusive fitness. Although people are believed to operate at a particular level of moral reasoning (Flanagan, 1984; Krebs, Vermeulen & Carpendale, 2014), it seems reasonable that their behaviour may be affected by the extent to which the person committing the act of wrongdoing has a close relationship with the person witnessing wrongdoing. Broadly in line with the arguments of Hamilton's (1964) biological concept of inclusive fitness, individuals help those to whom they are related in preference to those with whom they share no genetic ties. In the context of the study reported here, it might be expected to find that

when witnessing wrongdoing, the witness might be less likely to report a 'friend' or a 'family member', than a person with whom they share no such relationship. The second hypothesis was therefore:

Hypothesis 2: Whether participants felt they had to take action in the situation presented to them would differ according to the level to which they are related to the person responsible for wrongdoing.

The primary aims of the current study were therefore: i) to investigate the level of moral reasoning of aviation employees, when faced with evidence of wrongdoing, in relation to their intentions to intervene in wrongdoing situations, and ii) to investigate the effect of the relationship between the witness and the act of wrongdoing in aviation.

METHOD

Participants

One hundred and seventy-five (175) participants were recruited from 142 aviation organisations within New Zealand: flying clubs (91), flight training schools (15), aviation associations (5), air services (16), and air charters (15). Of these participants, 163 held a pilot's license at the time of participation.

Materials and Design

Overview

A scenario based study was designed to investigate participants' moral reasoning and the effect of the relationship between observer and protagonist when evaluating wrongdoing situations in the aviation industry. Using nine separate scenarios, participants were asked what they would do upon

becoming aware of wrongdoing and then to explain their decisions in the context of established theories of moral reasoning.

Investigation of the effect of the relationship between the observer and the protagonist when evaluating wrongdoing situations in the aviation industry was therefore a within-subjects experimental design. Investigation of the relationship between participants' level of moral reasoning and whether they chose to act upon hearing of wrongdoing was correlational design.

Nine scenarios were developed from accident and incident reports published on the Civil Aviation Authority of New Zealand (CAA NZ) website (www.caa.govt.nz). Real-life examples of accidents and incidents were chosen as the basis for developing the scenarios for the current study as they represented the kind of situations that aviation employees are known to have encountered in real life. The accident and incident reports were selected so that the scenarios used in the study could be short, easy to understand, cover different examples of wrongdoing, and be manipulated as required for the purpose of the current study. Any identifiable features in the original reports were omitted from the scenarios (e.g., names, places and dates).

To explore whether aviation employees' actions and reasoning behind these actions were affected by the level to which they personally were related to the protagonist, the scenarios were further divided into three groups. Each group contained three scenarios worded so that the relationship between the participant and the protagonist would be: i) participant not related to the protagonist (e.g., the wrongdoing behaviour was committed by someone that the participant does not personally know); ii) participant related to the protagonist (e.g., the wrongdoing behaviour was committed by a colleague); and iii) participant closely related to the protagonist (e.g., the wrongdoing behaviour was committed by a friend or a family member).

In an attempt to reduce the possibility that the level of relatedness in each scenario would interact with the perceived seriousness of the wrongdoing

described in the scenario, the wrongdoing behaviour in each of the nine scenarios was assigned a seriousness rating of 1 to 10 (where 1 = not very serious, and 10 = very serious) by the researcher, an academic with an interest in the study, and an independent third party. By summing the three seriousness ratings for each scenario, an overall seriousness rating was then calculated for each scenario (possible scores range from 3 to 30, with higher scores indicating higher perceived seriousness). The nine scenarios were arranged in descending order of seriousness and then manipulated so that the total seriousness rating for each level of relatedness (not related = scenarios 1, 2 & 7, related = scenarios 3, 5 & 6, closely related = scenarios 4, 8 & 9) were as similar as possible. The seriousness scores for the scenarios were score 21 for scenarios 1 & 8, score 20 for scenarios 5, 6, 7 & 9, score 14 for scenario 4, and score 13 for scenarios 2 and 3). The order in which scenarios were presented to participants in the actual study was randomly determined.

Development of Response Options for Scenarios

For each of the nine scenarios, participants were requested to answer two questions: question 1 to determine whether participants believed that they would take action in the wrongdoing situation, and question 2 to provide an indication of the participants' moral reasoning associated with their answer to question 1. Therefore participants were first asked (question 1) if they would take action in each of the situations (Yes/No), then select from a series of six response options (question 2) that best explain their answers to question 1.

A series of response options were developed for question 2 to attempt to measure whether a participant's level of moral reasoning was Pre-conventional, Conventional, or Post-conventional. The current study used both Kohlberg's and Gilligan's stage theory of moral reasoning as it has been argued that people may have distinctly different orientations towards moral reasoning,

based upon a 'justice' perspective or a 'care' perspective. As both theories essentially relate to three levels of moral development, a participant's reasoning would be considered at a higher level if, for example, they selected Gilligan's Conventional level rather than Kohlberg's Pre-conventional level of reasoning. Response options for each scenario were labelled K1, K2, K3, G1, G2, and G3, relating to the explanations corresponding to levels 1, 2, and 3, of Kohlberg's and Gilligan's theories of moral reasoning, respectively.

Finally, to enable between-group comparisons, participants were asked to report whether they held a pilot's license, and if so, how long it had been held.

Procedure

A total of 142 businesses in New Zealand were selected using the search engines Google and Yahoo, from which a total of 310 email addresses consisting of 102 personal email addresses (personal email addresses of staff), and 208 general email addresses (email addresses beginning with 'info', 'enquiries', organisation's name, etc.) were extracted. Each personal email address was sent a personalised email invitation to anonymously participate on the online survey. For the general email addresses, the email invitation asked the receiver to anonymously participate and also distribute the email invitation among their colleagues. No questions through which a participant could be identified were included in the interview, and no personal or identifiable information was recorded on the data sheet.

The survey was administered electronically via a website developed by the researcher to which participants were directed to complete the survey.

RESULTS

The level of statistical significance, alpha, was set at $p = .05$ for all statistical tests, and all tests were conducted as two-tailed.

Overall, there were 175 completed surveys. However, as it is not known how many participants were approached (as email respondents were asked to distribute the original invitation to others aviation employees within or outside their organisations), it is not possible to calculate the exact response rate. That said, if only original invitations were considered, this would equate to a response rate of 56%. Although this may seem high, similarly high responses rates have been found in New Zealand aviation research (e.g. 60% in Gilbey, Fifield, & Rogers, 2006).

For each scenario, Chi-Square test for goodness of fit (Elliott & Woodward, 2016) was used to ascertain if there was a statistically predominant response (Yes/No) to question 1. In scenarios 1, 5, 6, and 8, there was evidence that participants were statistically more likely to report that they would take action, but there was no statistically predominant response for scenarios 2, 3, 4, 7, and 9 (i.e., in the latter, participants were equally likely to report that they would take action or not take action).

For each scenario, the relationship between the seriousness ratings and the percentage of participants who stated that they would take action was tested using Spearman's rank order correlation. There was evidence that the relationship between the assigned seriousness ratings and participants' intention to take action was significant, $r_s = .694$, $n = 9$, $p = .04$; that is participants were more likely to take action in the scenarios that were judged to be more serious.

To investigate the relationship between intention to take action and flight experience amongst participants who were pilots, a median split was calculated for the time a pilot license was held (value 4 years). A Chi-Square test using flying experience (low = less than 4 years vs. high = equal to or greater than 4 years) and reporting intention (*Yes/No*) were conducted for each scenario¹. Results of the Chi-Square test of independence indicated that no comparisons achieved statistical significance, which suggested that a pilot's flying

experience did not appear to be related to their decision to take action for any scenario.

To test whether participants were more likely to take action was associated with how close they were to the hypothetical protagonist in each scenario, the number of each participant's *Yes* response was calculated for the 3 scenarios of each level of relatedness (thus, the range of scores for each level of relatedness for each participant was 0-3). Application of Friedman's test (Elliott & Woodward, 2016) suggested evidence of statistically significant changes in the distribution of responses associated with the level of relatedness to the event, $\chi^2 = 65.55, df = 2, p < .001$. Follow-up pair-wise applications of the Wilcoxon Test show that participants were more likely to intervene if they were *not related* ($M = 2.27$) than closely related ($M = 1.71$) to the protagonist, ($Z = 6.46, n = 159, p < .001$), and more likely to take action if they were *not related* ($M = 2.27$) than *related* ($M = 1.75$) to the protagonist ($Z = 6.67, n = 161, p < .001$). There was no statistically significant difference in the likelihood of taking action between *related* ($M = 1.75$) and *closely related* (1.71) ($Z = .68, n = 157, p = .496$).

Due to low expected cell counts for some combinations of responses to question 2, it was not possible to statistically explore the relation-

ship between all possible answers in relation to responses to question 1. Therefore, to test whether participants who answered *Yes* to question 1 for each scenario tended to operate at a higher level of moral reasoning than participants who answered *No*, the level of moral reasoning (i.e., Pre-conventional, Conventional, Post-conventional) was used for question 2, rather than the more detailed levels of either Kohlberg's or Gilligan's moral development theories (thus making the analysis 2×3 , rather than 2×6). Chi-Square tests of independence were then calculated for each scenario using participants' responses to question 1 (*Yes/No*) and their corresponding level of moral reasoning to question 2, Pre-conventional (PreC), Conventional (Conv), Post-conventional (PostC) as data. The results of the Chi-Square tests of independence are shown in Table 1.

With the exception of scenario 6, there was evidence of a significant relationship between participants' decision to become involved and their reason for their decision; that is, participants who reported that they would take action seemed to operate at a higher level of moral reasoning than participants who reported that they would not take action. Table 1 shows that when participants responded that they would take action (*Yes*), the modal explanation for why they did so, in all

Table 1. Relationship between response to question 1 and level of moral reasoning indicated in question 2

Scenario	Chi-Square Test of Independence				Modal Response	
	<i>n</i>	<i>df</i>	X^2	<i>sig</i>	<i>Yes (n)</i>	<i>No (n)</i>
1 nc	166	2	49.81	<.001	Conv (22)	PreC (21)
2 c	145	2	69.95	<.001	Conv (44)	PreC (54)
3 c	149	2	57.80	<.001	Conv (37)	PreC (49)
4 cc	153	2	70.86	<.001	PostC (40)	PreC (38)
5 nc*	71	2	12.99	<.001	Conv (66)	PreC (9)
6 c*	75	2	2.98	.231	Conv (68)	PreC/Conv/postC (6)**
7 nc	156	2	72.84	<.001	Conv (70)	PreC (52)
8 cc	166	2	70.92	<.001	Conv (56)	PreC (32)
9 cc	165	2	53.95	<.001	Conv (55)	PreC (43)

*Fisher's exact test was used, due to one or more expected cell counts being less than 5

** There was no single modal response to question 2 for participants who answered No to question 1; that is, each level was chosen the same amount of times.

except scenario 4, was consistent with conventional reasoning. Contrarily, when participants responded that they would not take action, the modal level of moral reasoning was most likely to be Pre-conventional.

To explore whether participants' level of moral reasoning was related to their degree of relatedness to the protagonist, participants' answers to question 2, indicating their level of moral reasoning for each scenario, were assigned a numerical value (i.e., Pre-conventional = 1, Conventional = 2, Post-conventional = 3). The numerical values were then summed for the three scenarios of each level of relatedness (the range of possible scores for each participant's answer to question 2 would therefore be 3–9 for each level of relatedness, with lower values suggesting lower levels of moral reasoning and vice versa). Application of Friedman's test suggested that there were no statistically significant changes in the distribution of levels of moral reasoning associated with the level of relatedness to the event, $\chi^2 = 3.35$, $df = 2$, $p = .188$. The mean scores were: *closely related* = 6.15 ($SD = 1.45$); *related* = 5.87 ($SD = 1.20$); and *not related* = 5.99 ($SD = 1.47$).

DISCUSSION

The first aim of this study was to explore whether differences in the level of moral reasoning were associated with differences in intentions to intervene in wrongdoing situations as one means of understanding under-reporting in aviation. There was evidence that, for eight of the nine scenarios tested, there was a significant association between whether participants believed that they would intervene upon becoming aware of wrongdoing and their level of moral reasoning. Specifically, with the exception of scenario 6, the modal level of moral reasoning was higher for participants who stated that they would intervene than participants who stated they would not intervene. As such, the relationship between participants' level of moral reasoning and their intentions to

intervene in wrongdoing provides evidence to support Hypothesis 1.

The findings of the current study indicate that when people become aware of wrongdoing in aviation, there is a great deal of uncertainty in their evaluation as to whether they believe that they would or would not become involved (i.e., Yes/No answers). For example, in five of the nine scenarios there was no statistically predominant response for what they would do on becoming aware of wrongdoing – that is, in five of the nine scenarios participants were equally likely to not intervene than to intervene. However, in four of the scenarios there was a statistically predominant response (take action), but nevertheless, the percentage of participants who would not intervene still ranged between 8% and 35%. In principle, this finding confirms that despite reporting of safety concerns being a legal requirement, under-reporting is still one of the key problems facing the aviation industry (NZALPA, 2005). Communicating safety concerns through the appropriate channels, as seen in the case of the Air Adventures accident, could have helped avoid the accident that ultimately occurred (CAA NZ, 2006). Thus, this study again shows that under-reporting is likely to occur and on occasions, it could lead to accidents such as that of Air Adventures.

Although there was a low rate of intentions to intervene in wrongdoing situations, which was arguably consistent with accidents such as the Air Adventures accident, there was however, a strong relationship between perceived seriousness of the wrongdoing and likelihood of a participant acting upon such wrongdoing. Although a causal relationship would need to be determined, this relationship does suggest that emphasising the importance and potential negative implications of any wrongdoing could be a means of raising the level of reporting.

This study also manipulated the level of relatedness between the person assessing the situation (i.e., the participant) and the person(s) involved in wrongdoing, to investigate whether this affected participants' reporting intentions. Hypothesis 2,

stating that participants would differ about whether they felt they had to intervene or not depending on the level to which they were related to the actor in the wrongdoing scenario was supported. The results suggested that overall, participants believed that they were more likely to intervene in wrongdoing situations if they were not related to the person(s) involved in such wrongdoing, than if they were related or closely related to them. The findings showed no difference in the likelihood of intervening if the participant was either related or closely related to the person(s) involved in wrongdoing. As such, this finding supports the evolutionary perspective argued by Hamilton (1964), and demonstrates that 'relatedness' is a factor likely to affect aviation employees propensity to report wrongdoing in aviation.

Arguably, the nature of aviation is that it is indeed a tight knit community where many people who work together may socialise together. For example, "The aviation industry is a unique business made up of a tight-knit community with a special bond in common" (Dawson Aircraft, 2010). This means that in some instances where people become aware of wrongdoing, it is likely that they have a relationship to the protagonist. If this relationship is closely related, or even just related, then the current findings indicate that this could result in higher levels of under-reporting. Indeed, there are reasons to suspect that the lack of communication of concerns prior to the Air Adventures accident was an example of this possibility. The influence of close relationships may prove difficult to overcome, as the aphorism 'not report on people' may be even more likely to occur if there is a close relationship between the wrongdoer and the observer of wrongdoing. Nevertheless, it is possible that ethical education or clearer reporting guidelines could allow the effect of close relationships to be set aside when considering the potential implications of not reporting wrongdoing.

An exploratory test of the relationship between the length of time a pilot had held a pilot's license and their stated intention to intervene failed to

find any evidence of a relationship. However, it is possible that this lack of evidence may have been confounded by other factors; for example, pilots who had held their license longer may in principle be less likely to intervene and also have built more close friendships in their industry. Moreover, the use of median split as a basis for comparison between groups may have failed to reveal that a difference could exist if a different value had been used.

Overall, there was evidence that when people become aware of wrongdoing that involves a person to whom they are closely related, they will be less likely to intervene. In line with the arguments of inclusive fitness concept (Hamilton, 1964), it could therefore be assumed that the more related the individual to the person involved in wrongdoing, the less likely that the individual will take corrective action in the wrongdoing situation.

LIMITATIONS

A number of potential limitations are noted in the current study. First, as participants were a self-selecting sample, this may limit the generalisability of the results to all aviation employees. Second, it should be acknowledged that there may have been differences in interpretation of wrongdoing scenarios presented to participants. Although the scenarios were based on real-life wrongdoing situations and have been reported on the regulatory authority's incident and accident database, there is a possibility that given people's differences in background, education and experiences, not all participants would have viewed the presented scenarios as wrongdoing situations, or agreed with the level of seriousness assigned to each of these scenarios. Third, it has long been recognised that people do not always behave in a way that is consistent with the beliefs that they express (LaPiere, 1934). As such, it is unclear to what extent these hypothetical findings would hold true in real life situations, although later studies have shown that

attitudes are a good predictor of behaviour (e.g., Sheppard, Hartwick, & Warshaw, 1988).

FUTURE RESEARCH DIRECTIONS

Finding evidence that there is a relationship between people's level of moral reasoning and whether or not they would intervene (e.g., report their concerns about something they perceive to be wrongdoing) suggested at least two potential directions for future research. One approach would be to carry out an intervention study using participants that stated they would not take action in wrongdoing situations and provide half of them with, for example, a short course in business and workplace ethics, whilst the other half would serve as a control condition. If, subsequently, there was found to be a causal relationship between level of moral reasoning and intention to intervene, then this would be good evidence that ethics education would be a potentially efficacious means to increase safety in aviation. A second and perhaps more pragmatic approach would be to investigate ways in which information about what should be reported could be made available to aviation employees. Nevertheless, there is some evidence to support the former approach as research has suggested that education may indeed help to improve people's levels of moral reasoning (Rest, 1986; Self, Baldwin, & Wolinsky, 1992; Holm, Nielsen, Norup, Vegner, Guldmann, & Andreasen, 1995), whilst it would be difficult to ensure that a list of what should be reported would be exhaustive.

CONCLUSION

In conclusion, the findings of the current study suggest that there is an association between participants' level of moral reasoning and their likelihood to intervene upon observing wrongdoing in an aviation context. There was clear evidence that whether or not wrongdoing is communicated depends very much upon who it is that observes

it and also upon their relationship to the person committing the wrongdoing. This study therefore makes a significant contribution in uncovering some of the issues that lead to underreporting of wrongdoing. Indeed, findings of this study can almost certainly be used to contribute and improve knowledge in areas other than aviation.

KEY TERMS AND DEFINITIONS

Conventional Level: For Kohlberg, this level is about acceptance of the rules and standards of one's group. For Gilligan, this level is characterised by responsibility: 'Good' is equated with caring for others.

Ethics: A set of standards of right and wrong, good and bad.

Gilligan's Moral Development Theory: An alternative theory to Kohlberg's theory, proposed by Gilligan (1982) that argues that ethical decisions based on justice and fairness were incomplete. Gilligan called her theory "ethics of caring", it is a stage theory of moral development for women grouped into three major levels: pre-conventional, conventional, and post conventional. For Gilligan, the transitions between the stages are dependent on changes of the self and the environment in which the self lives, rather than the Kohlbergian changes in cognitive capability.

Kohlberg's Moral Development Theory: A theory proposed by Kohlberg (1976) in which he described six stages of moral reasoning grouped into three major levels: pre-conventional, conventional, and post-conventional. Kohlberg believed that individuals could only progress through these stages one stage at a time; one cannot get to a higher stage without passing through the stage immediately preceding it. Individuals could only come to comprehending a moral rational one stage above their own.

Morality: The application of ethical standards.

Post-Conventional Level: For Kohlberg, this level is where ethical principles are considered. For Gilligan, this level is characterised by the focus on eliminating tensions between self and others, and accepting the principle of care as a universal ethical principle which condemns exploitation and hurt in our life and others.

Pre-Conventional Level: For Kohlberg, this level is where behaviour is motivated by anticipation of pleasure or pain. For Gilligan, this level is characterised by caring for the self in order to ensure survival. In this level, women begin to see connections between themselves and others.

Wrongdoing: In the context of this study, wrongdoing is used to imply instances of behaving or acting in a way that is inconsistent with safety practices, not limited to practices that are against the law.

ENDNOTE

- ¹ Although anecdotal evidence suggests that 1000 hours (personal communication) is a useful value for determining experience

(high/low), in the current study, the term low and high are used simply to denote to which half of the medium split a participant was assigned.

Science, Ethics, and Weapons Research

E

John Forge

Independent Researcher, Australia

INTRODUCTION

If it were not for *weapons research*, there would be no predator drones or smart bombs or improvised explosive devices or assault rifles. The insurgents in the Middle East and elsewhere would have no means to fight, and there would be no wars, large or small. Even more importantly, there would be no vast arsenals of thermonuclear weapons capable of ending much of the sentient life on the planet. The world would then most certainly be a safer place. But weapons research is not something new: the gunpowder weaponry of the early modern period was the product of research, as were the torsion catapults in Greece at the time of Philip and Alexander of Macedon. Whatever else is true about weapons research, it is clear that it introduces new (or improved) means of killing and destruction, and this is sufficient to define the activity.¹ This would appear to be a very weighty matter, something that one might imagine philosophers, and others who think about such things, would have had a lot to say; surprisingly, not much at all has been written on the subject, though some explanation of this neglect will be given in this chapter.

The main issue for *ethics* and weapons research centres on the ethical or moral evaluation of the activity: Is it *ever* morally justified to design the means to kill, harm and destroy, and if so, under precisely what circumstances? Turning to science and its relation to weapons research, the question here is the *role* that science plays in weapons research. Perhaps weapons research is a wholly (applied) scientific endeavour or perhaps science is a part of weapons research? Bringing ethics back in, if weapons research is deemed morally

wrong, then is it the case that *whatever* role science plays is also wrong? To answer these questions, three examples will be given which will help to clarify the roles that science can play in weapons research. If weapons research itself is understood as applied science, as it is by Arrigo for instance (Arrigo 2000: 303), then one might expect this to entail the application of theory to the design for new weapons, for true or radical innovation. But there are other ways in which science can inform weapons research, as will be seen presently. Before moving on to these examples, it is worth making some general, and very brief, comments about ethics and the way it can apply to an intellectual activity such as science. This is worth doing because it cannot be assumed that the audience for the present topic is familiar with philosophy or ethics, but it is necessary to have a framework.²

BACKGROUND

A straightforward way to describe ethics is to say that it is a study which deals with what persons ought and ought not to do. It is thus to do with the choices, actions and behaviour of mature competent people. Some of the things that people do do not affect others, other humans, other sentient beings, in any significant way and hence these do not come under the purview of ethics. Those actions that do affect others are, however, open to moral or ethical evaluation: are they right or are they wrong? To resolve that question, one needs to appeal to a moral system. All such systems forbid certain actions, namely those that inflict unjustified harm on others. This is surely intuitive and obvious: *no one* wants to be harmed. It is almost

by definition that no sentient being wants to feel pain - assuming that the pain does not indicate that some medical treatment is working or some such – and to be in pain is one form of being harmed.

Some moral systems require people not only to refrain from harming others but also to provide some positive benefit for them. Jeremy Bentham and John Stuart Mill, the nineteenth century English philosophers, famously believed that one ought to strive to increase the amount of happiness in the world. However, morality is supposed to be *impartial* in the sense that it forbids discrimination in regard to moral action. Prohibitions on harming do not end with family or friends or community or country: *nobody* should be harmed, no one at all. Some critics of the style of morality advocated by Bentham and Mill have pointed out that it is impossible to increase the amount of happiness in the world impartially: no one can make everyone happy! Just how serious this objection is is a matter of ongoing debate. But it is only necessary here to note that this kind of moral system shares the prohibition on harming with the former kind: for the topic at hand, it is clear that the moral evaluation of weapons research, whatever else it might involve, will not be such as to see it as an activity which aims to increase the amount of happiness in the world.

Most philosophers do not believe that the dictates of morality are absolute and cannot be broken in any circumstances. For example, most accept that a moral rule such as “Do not cause pain” has justified exceptions. Clearly, a dentist who inflicts pain on her patient to save his teeth has not done something morally wrong – provided that the patient understands and assents to the treatment. Also, it is generally agreed that it is permissible to cause pain in self-defence, if that is the only way to defend oneself. This leads to the view that *justifiable* exceptions to the overall moral prohibition against harming will be such as to show that the harm inflicted will prevent other harms. Just how this is worked out will vary from case to case, and it is here that much of the hard work in ethical reflection and evaluation takes place. One might think as a basic principle that

the harms prevented should be at least as much or many or as great as the harms caused if there is to be justification, and that therefore it must be necessary to be able to make some informed assessment of what these might be. This brings the discussion back to weapons research, an activity that aims to provide the *means* to harm. It is now necessary to look at some examples.

1. It is well-known that both kinds of nuclear weapon, fission and fusion weapons, were the *direct results* of the application of scientific theory to design. Without advances in nuclear physics in the 1930s and 1940s, the very idea of a nuclear weapon would not have been dreamed up. Rhodes gives an excellent account of the genesis of the idea of a fission weapon, from the speculations of Szilard from 1933 to his work with Fermi in the US, and the ‘memorandum’ written by the émigré scientists Frisch and Peierls in England which made predictions about crucial nuclear parameters. The designs of the two kinds of fission bombs made during the Second World War were determined by the properties of the fissile materials used, matters that were uncovered by painstaking research.³ The idea for a thermonuclear weapon emerged from the atomic bomb project, and was also driven by science and by scientists. Indeed, the fusion reactions that power these weapons must be initiated by ‘fission triggers’, so not only did the research into fission or atomic bombs lead to thermonuclear weapons, the products of the former were integral elements of the latter.⁴

The research leading to nuclear weapons was exceptional in that scientists, including all of those mentioned above, took the initiative in agitating for programmes to investigate the possibility of using the recently discovered fissile materials for a weapon of terrible destruction, to the subsequent regret of some of them. The military is now well-aware of the power of science and has set up agencies to oversee the application of scientific

theory to the design of new weapons systems. The best-known is the US's Defense Advanced Research Projects Agency, or DARPA; notice that, in common with armed forces the world over, the word "defense" appears in its name. There are equivalents in Russia, China, the UK, France, Israel and other countries.

2. In the nineteenth century the weapons that caused the majority of fatalities and injuries in war, artillery and the infantryman's longarm, were transformed by the scientific analysis of existing armaments. Smoothbore cannon and muskets were transformed into steel, breech-loading guns whose recoil was damped and rifles firing clips of cartridges using smokeless powder.⁵ These are instances of science *improving* existing designs. One example will be given as an illustration. All smoothbore weapons which fire balls, musket and cannon balls, are inherently inaccurate because of uncontrollable forces which act on balls as they spin in the air after leaving a gun barrel. This is called the Magnus Effect or Magnus Force, after the German physicist Heinrich Magnus who described it in 1852. It was also investigated by the English physicist Benjamin Robbins, in his book *The New Principles of Gunnery*, published a century before Magnus' work (Steele 1994: 359). The effect is this: unless a ball only spins about the axis in the direction it is travelling, what is called the roll axis in aeronautics, it will experience unequal pressure on either side in the direction of its motion, and hence be deflected in the direction of the axis of spin. In other words, it will not travel straight, and if it actually hits (anywhere near) its target, then this is a matter of luck.

This analysis showed that if only the bullet could be made to spin about the roll axis, accuracy would be greatly increased. The first attempts to do so involved 'rifling' musket barrels, fitting them

with raised 'lands' spiralling down the inside of the barrel which caused the ball to spin about the required axis. There were two problems: the rifled musket was very slow to load because the ball had to be hammered down the barrel, and the barrel became fouled after only a few shots because the powder residue collected around the lands. These problems were solved by three innovations. There were, in the first place, advances in metal working that allowed relatively efficient breech-loading rifles – leakage of gas from around the breech was eventually dealt with by gunsmiths such as Paul Mauser. Then there was progressive improvement in propellant until eventually smoke-less powder became available. Finally, bullets were designed that would not stick in the barrel on the lands. The idea was that the bullet would have two parts; a base that was made out of a relatively soft material that would deform in the lands and impart a twist to a hard core made narrower than the base so that it would not stick in the barrel. After two attempts in England in the 1820s, eventually a French innovation by Captain Claude-Étienne Minié of the French Chasseurs was successful in 1847.⁶ This led to many orders of magnitudes increase in lethality: in the American Civil War over half a million casualties, including two hundred thousand killed, were caused by 'Minié rifles'.

3. The application of scientific theory, either to produce quite new weapon designs or to improve existing ones, is a relatively new phenomena, beginning with the study of ballistics in the seventeenth century (see Hall 2009). However, *systematic* research into weapons design took place at least as far back as the fourth century BCE. Remarkable work was done in that century in relation to the design of the torsion catapult, which marked the beginning of effective siege artillery. A torsion catapult works because of the restoring force exerted by 'springy' material, like rope, which has been stretched. Wrapping rope around a stout piece of wood fixed to a frame, embedding a handle in the

mass of rope and then pulling the handle back will create a torque: the handle will fly back to its resting position when released. It can be therefore seen how, in principle, such a device can be used to cast stones when placed in a basket attached to the handle.

It is not known how the Greek engineers discovered the torsion principle and applied it to designing catapults, but this must have been done *empirically* as the theory was not formulated until much later. However, the design of torsion catapults was codified in treatises which gave general instructions how to build them. These instructions were general because formulae, known as the hole formulae, gave the key parameter for casting stones of a given weight or arrows of a given length. The Greek engineers had discovered formulae that related the optimal size of the hole in the catapult frame in which the wood about which the rope or springs was to be wound to the weight of the stone or length of the arrow. The former is more complex and involves a cube root, which gives an equation that Greek mathematics at the time could not solve exactly. Perhaps still more remarkably, the treatises gave approximation methods for solving the equations in question.⁷

FUTURE DIRECTIONS

If weapons research is morally wrong, then it would appear that the actions of any scientist who contributes to weapons research are also morally wrong. But the matter is not quite so straightforward. A scientist who knowingly, willingly and intentionally engages in weapons research is as open to moral censure as any other weapons researcher, assuming that weapons research is a proscribed activity. It is not so clear, however, that a scientist who does not intend that her work be used to further the ends of weapons research, but sees that it may well in fact do so is also blameworthy. It is less clear still that a scientist who does not foresee this outcome, assuming it comes

about, is to blame. It would not be necessary to address any of these issues if weapons research was not morally wrong, so this matter must now be discussed.

It was mentioned above that the topic has received much less attention than it deserves.⁸ Forge, who has addressed the topic at some length and argued that weapons research is morally wrong under all circumstances, believes that the question of the morality of weapons research has been assimilated to questions about the justness of war, about which a great deal has been written of late, and he believes this is a mistake (Forge 2013: ix). The consensus about war is that war is just or morally permissible – no blame attaches – if it resists aggression. This is the ‘modern view’ which sees just war as more than self-defence, other defence being allowed if the other is the victim of aggression. The implicit corollary is that measures such as weapons research are justified if they aid in the prosecution of a just war or in the pursuit of self-defence or deterrence.⁹ This is the standard rationale or *standard justification* of weapons research. Forge denies that this justification is convincing. However, Kemp, one of the few who have discussed the ethics of weapons research, claims that it is not only permissible to undertake weapons research for defence, and maintains that it is a *civic duty* imposed on scientists to do so (Kemp 1994). Forge and Kemp therefore adopt diametrically opposed viewpoints, and the topic can be explored by comparing and assessing their respective positions.

Kemp claims that since the state has a duty to protect its citizens, and since Hobbes many political philosophers believe that this is the *raison d’être* of the state, then those who are able to assist in this vital endeavour by designing the means for defence have a duty to do so. Note that a civic duty in this sense is not a *moral* duty, as it only applies to a part of the moral community, namely one’s fellow citizens, and hence lacks the (completely) impartial character of morality. Expressed in these terms, Forge’s view is that it is moral duty *not* to undertake weapons research.

Forge does not deny that states have a right to defend themselves, or defend others from aggression, nor does he deny that weapons research can help to achieve these ends. What he does deny is that this is *all* that weapons research does, namely provide the means to resist aggression, whatever the intent behind it. Note also that Kemp's position is compatible with weapons research being permissible while Forge's is not. Which is correct? Kemp's view seems to be convincing, but when weapons research is analysed in more depth, this initial reaction is seen to be wrong.

Hacking maintains that what weapons research produces in the first instance is *knowledge*, instructions for making new or improved weapons, not hardware (Hacking 1986).¹⁰ Weapons research is not the same thing as weapons manufacture. A scientist who successfully discharges her civic duty does not therefore provide a *unique* array of defensive weapons for her country, but a *design*, and any institution with the requisite skills and resources could produce identical weapons if it possesses the design. For instance, the Kalashnikov, the AK-47, the most widely made weapon of all time, has been manufactured from 1947 by the Soviet Union, Russia, Poland, Hungary, East Germany, Bulgaria, Romania, China, North Korea, Yugoslavia, Iraq, Egypt and India, and variants by Finland, Israel and South Africa.¹¹ Mikhail Kalashnikov invented a highly effective assault rifle, but should he be praised for discharging his civic duty or condemned for introducing into the world a terrible new means to kill? Clearly, his innovation spread beyond his own country. Successful weapons tend to become ubiquitous. Both sides in the American Civil War used 'Minié rifles', as did both sides in the Franco-Prussian War of 1871. By the First World War, all protagonists had machine guns, quick-firing artillery as well as reliable rifles. There was less uniformity in the armaments of the Second World War, though all sides had tanks, bombers, fighters, field artillery and so forth, and there is still less uniformity today. This trend is due to the vastly increased pace of weapons research and it is to be expected

that states will strive to copy successful weapons innovations as much as they can. This may not be easy and it may not always be clear how it can be done, but the very fact that many different countries come up with weapons that are remarkable similar shows that it happens. Weapons innovation cannot be contained in time or space.

If successful weapons innovation does not lead to a unique array of weapons, perhaps this does not matter if leads to weapons that can *only* be used to defend against aggression – perhaps Kemp's position can be resurrected along the lines that designing defensive weapons is a civic duty? The role of a defensive weapon, or weapon that is postured defensively, is to actively protect an asset, but this does not necessarily amount to defending against aggression. The work of Luttwak on the levels of strategy shows the relationship between defence and its strict 'opposite' offence is complex and multi-faceted.¹² One implication of Luttwak's analysis is that a state that would embark on a war of aggression needs a range of defensive options. It needs to be able to defend itself, its 'homeland', from retaliation, it needs to defend captured territory and its forces in enemy territory from counter-attack, etc. Thus, if the overall theatre or grand strategy is one of aggression, with the long-term goal of capturing territory or otherwise exerting hegemony, at 'lower' levels defensive tactics and even defensive operations may be necessary at certain times and places, and conversely. Fighting on the Eastern Front in the Second World War, after Hitler invaded the Soviet Union, exemplified this dynamic. At the level of grand strategy, Hitler was waging an aggressive war of conquest, while Stalin was defending. But even as early as the third month of the war, the Germans were mostly on the defensive, with their infantry holding positions while their tanks, the main instrument of the blitzkrieg operations, were being repaired and refitted.¹³ Thereafter, the German offensive re-commenced, stalling finally in November 1941 in front of Moscow, and the next two years the protagonists defended and attacked one another in turn until the Soviet

Union began to prevail. All the weapons both sides had at their disposal were used in all forms of fighting, including tanks that were deployed in mobile defence: there were no weapons *only* used for defence. Kemp's position therefore cannot be salvaged.

Forge maintains that since weapons are, by their very nature, the means to harm, then research which aims to introduce new or improved weapons into the world requires justification, and that the only possible justification is that the weapon in question will prevent more harm than would be the case were it not available.¹⁴ This kind of justification lies behind all references to defence in relation to weapons research, military spending and so forth. But this demand cannot be satisfied: weapons research produces knowledge in the form of designs which can be implemented in the future in circumstances that are unknowable – as the examples discussed above have shown – and since there is no such thing as a weapon that cannot be used to aid aggression, there can be no assurance that an episode of weapons research will produce a weapon that prevents more harm than it causes. It is precisely this assurance that is needed if weapons research is to be justified, hence Forge argues that weapons research is always unjustified. The historical record shows that wars have become more frequent and more deadly since scientific advances began to be applied systematically to weapons research, and so the facts seem to support Forge's position. But these important issues surely need more discussion, not just from philosophers and others who reflect on weapons research, but from the scientists and other experts who actually take part.

CONCLUSION

Returning to focus again explicitly to the role of scientists, if weapons research is morally wrong and without justification, then scientists, just like everyone else, should not take part. A scientist who knowingly and deliberately takes part in an

activity that is morally wrong is as blameworthy as any other participant. However, there are different ways in which scientists can be said to participate. For instance, a scientist can receive a grant from the military even though she does not intend to undertake weapons research and does not see how her work might provide a basis for weapons research. But, the military only sponsors research it thinks might be useful for its own ends, including weapons research, and this is a good reason why scientists should not accept such funding. It is also possible that a scientist knows she is conducting research that could have military application without being sponsored by the military. This happened in the late 1930s when some members at least among the scientific community believed that current advances in nuclear physics could contribute to a weapon of mass destruction. The majority of scientists working at the time, including Hahn and Strassman, the discoverers of nuclear fission, saw themselves as 'pure' research scientists. Szilard sought a moratorium on publishing papers on nuclear physics in order to try to prevent such nuclear weapons research, with limited success (Rose 1998; 92). This raised complex questions about the responsibility of scientists for applications of their work that they do not intend, or even foresee, but these are questions beyond the scope of this chapter.

ENDNOTES

¹ Forge has given the following definition: Weapons research is research carried out with the intention of designing new weapons, or improving the design of existing weapons, or designing or improving the means for

carrying out activities associated with the use of weapons, Forge, 2013: 14.

² The writer's own webpage, www.moralitymatters.net, contains some introductory material, together with more on the topic of this chapter, and also more references.

³ See especially Rhodes 1986; for his discussion of Szilard, see 28-30, and for the Frisch-Peirels Memorandum see 321-325. Weart edited Szilard's papers, which were published in 1978, see Weart and Szilard 1978. Grandy has a more objective account of Szilard's contribution. Forge 2008 Chapter 8 is a short accessible overview of the Manhattan Project and the events leading up to it. For a more technical discussion, see Hodderon *et al.* 1993.

⁴ Rhodes' second book, Rhodes 1995, takes up where his first book ends, at the conclusion of the Second World War, and begins with a discussion of the Soviet atomic bomb project and moves on to the decision by the US to then proceed with thermonuclear weapons. Both books are important because they give background to the decisions to actually go ahead with the respective nuclear weapons research programmes, surely among the most momentous decisions of all time. For more on the decision to proceed with thermonuclear weapons research by one who was actually involved, see Acheson 1969, especially 344-349.

⁵ It was necessary to develop special steels for guns that used the new high explosives, both of which were due to advances in chemistry in the nineteenth century, see Manchester 2003. Manchester's book gives an excellent account of Krupps, the famous, or notorious, weapons manufacturer and innovator. Warren 1989 tells the story of George Armstrong, the English equivalent of Alfred Krupp. The problem of recoil, which had plagued gunners from the very beginnings of artillery, was solved at the end of the century by the French, see Zabecki 2004.

- ⁶ See Greener 1910: 629-632 for the two British attempts. An excellent account of Minié is in Hall 1997: 135-147. Walter 1979 is a comprehensive account of the nineteenth century German rifle innovation, especially in regard to the Mauser.
- ⁷ Marsden wrote two important books on this topic, which have become classics. One gives the historical development of Greek and Roman artillery, while the second reproduces four technical treatises, from the fourth century BCE to the first century CE, which give instructions for building catapults. Ri-hill is a more up to date, and perhaps more readable, general text on the topic, which does not always agree with Marsden.
- ⁸ Sarah Bridger's recently published *Scientists at War: The Ethics of Cold War Weapons Research* has, in spite of the title, almost nothing in it about ethics. It is however an excellent account of the attitudes of many of the leading US weapons researchers between the launching of Sputnik and Star Wars, with special reference to weapons research and the Vietnam War.
- ⁹ Some Just War Theorists, and some others, have argued that certain classes of weapons, especially weapons of mass destruction, are immoral but have not (even) gone on to state the corollary to that proposition that the weapons research that aims to produce weapons of mass destruction is immoral. Fotion, Fotion 1990, gives one of the best discussion of the issue from this restricted viewpoint.
- ¹⁰ This knowledge, in the form of designs, can be more or less well articulated, from the most basic and sketchy idea – for instance, using a chain reaction in a uranium assembly – to an engineering specification that could, in principle, be implemented entirely by machine. For more on this issue, see Stankiewicz 2000.
- ¹¹ For Kalashnikov's story in his own words, which must be taken with a grain of salt, see Kalashnikov 2006. For more details, and more objectivity, see Kanaher 2007.
- ¹² Luttwak 1987 is the main source. But see also Liddell Hart 1973 for various ideas about what could count as a defensive weapon.
- ¹³ See Stahel 200, especially Chapter 7 and the introduction.

Fuzzy Logic and Soft Computing

Application of Fuzzy Numbers to Assessment Processes

Michael Voskoglou

Graduate Technological Educational Institute (T.E.I.), Greece

INTRODUCTION

In the present work a combination of the COG defuzzification technique and of the TFNs (or TpFNs) is used as an assessment tool. Examples of assessing student problem-solving abilities and basket-ball player skills are also presented illustrating in practice the results obtained. This new fuzzy assessment method is validated by comparing its outcomes in the above examples with the corresponding outcomes of two commonly used assessment methods of the traditional logic, the calculation of the mean values and of the Grade Point Average (GPA) index. Finally, the perspectives of future research on the subject are discussed.

BACKGROUND

The *Fuzzy Numbers* (FNs) play an important role in fuzzy mathematics analogous to the role played by the ordinary numbers in crisp mathematics. This section contains the background from the theory of FNs, which is necessary for the purposes of the present work.

Fuzzy Sets and Logic

The fuzzy sets theory was created in response of expressing mathematically real world situations in which definitions have not clear boundaries. For example, “the high mountains of a country”, “the young people of a city”, “the good players of a team”, etc. The notion of a *fuzzy set* (FS) was introduced by Zadeh (1965) as follows:

1. **Definition:** A FS on the universal set U of the discourse (or a fuzzy subset of U) is a set of ordered pairs of the form $A = \{(x, m_A(x)): x \in U\}$, defined in terms of a *membership function* $m_A: U \rightarrow [0,1]$ that assigns to each element of U a real value from the interval $[0,1]$.

The value $m_A(x)$ is called the *membership degree* of x in A . The greater is $m_A(x)$, the better x satisfies the characteristic property of A . The definition of the membership function is not unique depending on the user’s subjective data, which is usually based on statistical or empirical observations. However, a necessary condition for a FS to give a reliable description of the corresponding real situation is that its membership function’s definition satisfies the common sense. Note that, for reasons of simplicity, many authors identify a FS with its membership function.

A crisp subset A of U can be considered as a FS in U with $m_A(x) = 1$, if $x \in A$ and $m_A(x) = 0$, if $x \notin A$. In this way most properties and operations of crisp sets can be extended to corresponding properties and operations of Fs. For general facts on FS we refer to the book of Klir & Folger (1988).

Fuzzy Logic (FL), based on FS theory, constitutes a generalization and complement of the classical bi-valued logic that finds nowadays many applications to almost all sectors of human activities (e.g. Chapter 6 of Klir & Folger, 1988, Voskoglou, 2011, 2012, 2015 etc.). Due to its nature of characterizing the ambiguous real life situations with multiple values, FL offers, among others, rich resources for assessment purposes,

which are more realistic than those of the classical logic (Voskoglou, 2011, 2012, 2015, etc).

The FL approach for a problem's solution involves the following steps:

- *Fuzzification* of the problem's data by representing them with properly defined FSs.
- *Evaluation of the fuzzy data* by applying principles and methods of FL in order to express the problem's solution in the form of a unique FS.
- Defuzzification of the problem's solution in order to "translate" it in our natural language for use with the original real-life problem.

One of the most popular defuzzification methods is the *Center of Gravity (COG) technique*. When using it, the fuzzy outcomes of the problem's solution are represented by the coordinates of the COG of the membership's function graph of the FS involved in the solution (van Broekhoven & De Baets, 2006).

Fuzzy Numbers

2. **Definition:** A FN is a fuzzy set A on the set R of real numbers with membership function

$m_A: R \rightarrow [0, 1]$, such that:

- A is *normal*, i.e. there exists x in R such that $m_A(x) = 1$,
 - A is *convex*, i.e. all its α -cuts $A^\alpha = \{x \in U: m_A(x) \geq \alpha\}$, α in $[0, 1]$, are closed real intervals, and
 - Its membership function $y = m_A(x)$ is a piecewise continuous function.
3. **Counter-Example:** Figure 1 represents the graph of a fuzzy set on R which is not convex and therefore it is not a FN. For example, it can be observed that $A^{0.4} = [5, 8.5] \cup [11, 13]$, therefore $A^{0.4}$ is not a closed interval.

Since the x -cuts A^x of a FN, say A , are closed real intervals, we can write $A^x = [A_l^x, A_r^x]$ for each x in $[0, 1]$, where A_l^x, A_r^x are real numbers depending on x .

The following statement defines a *partial order* on the set of all FNs:

4. **Definition:** Given the FNs A and B we write $A \leq B$ (or $\geq$) if, and only if, $A_l^x \leq B_l^x$ and $A_r^x \leq B_r^x$ (or $\geq$) for all x in $[0, 1]$. Two such FNs are called *comparable*, otherwise they are called *non comparable*.

Figure 1. Example of a non convex fuzzy set on R

5. **Remark:** One can define the four basic arithmetic operations on FNS in the following two, equivalent to each other, ways (Kaufmann & Gupta, 1991):

With the help of their α -cuts and the Representation-Decomposition Theorem of Ralescou - Negoita (Sakawa, 1993, Theorem 2.1, p.16) for FS. In this way the fuzzy arithmetic is turned to the well known arithmetic of the closed real intervals.

By applying the Zadeh's extension principle (Klir & Folger, 1988, Section 1.4, p.20), which provides the means for any function f mapping a crisp set X to a crisp set Y to be generalized so that to map fuzzy subsets of X to fuzzy subsets of Y .

In practice the above two general methods of the fuzzy arithmetic, requiring laborious calculations, are rarely used in applications, where the utilization of simpler forms of FNs is preferred.

For general facts on FNs we refer to the classical on the subject book of Kaufmann and Gupta (1991).

Triangular Fuzzy Numbers (TFNs)

A TFN (a, b, c) , with a, b, c in $\mathbf{R}$ represents the fuzzy statement "the value of b lies in the interval $[a, c]$ ". The membership function of (a, b, c) is zero outside the interval $[a, c]$, while its graph in $[a, c]$ consists of two straight line segments forming a triangle with the OX axis (Figure 2).

Figure 2. Graph and COG of the TFN (a, b, c)

Therefore the analytic definition of a TFN is given as follows:

6. **Definition:** Let a, b and c be real numbers with $a < b < c$. Then the TFN (a, b, c) is a FN with membership function:

$$y = m(x) = \begin{cases} \frac{x-a}{b-a}, & x \in [a, b] \\ \frac{c-x}{c-b}, & x \in [b, c] \\ 0, & x < a \text{ or } x > c \end{cases}$$

The following two Propositions refer to basic properties of TFNs that we are going to use later in this work:

7. **Proposition:** The x -cuts A^x of the TFN $A = (a, b, c)$, $x \in [0, 1]$, are calculated by the formula $A^x = [a + x(b - a), c - x(c - b)]$.

Proof: The x -cut $A^x = \{y \in \mathbf{R}: m(y) \geq x\}$ of the TFN A is a real interval of the form $A^x = [A_l^x, A_r^x]$, with A_l^x in $[a, b]$ and A_r^x in $[b, c]$ such that $m(A_l^x) = m(A_r^x) = x$. Therefore, by Definition 6 we

$$\text{have that } \frac{A_l^x - a}{b - a} = x \Leftrightarrow A_l^x = a + x(b - a). \text{ Similarly, by Definition 6 again, } \frac{c - A_r^x}{c - b} = x \Leftrightarrow A_r^x = c - x(c - b).$$

8. **Proposition:** (Defuzzification of a TFN) The coordinates (X, Y) of the COG of the graph of the TFN (a, b, c) are calculated by the formulas $X = \frac{a + b + c}{3}$, $Y = \frac{1}{3}$.

Proof: The graph of the TFN (a, b, c) is the triangle ABC of Figure 2, with $A(a, 0)$, $B(b, 1)$ and $C(c, 0)$. Then, the COG, say G , of ABC is the intersection point of its medians AN and BM . The proof of the Proposition is easily obtained by calculating the equations of AN and BM and by solving the linear system of these two equations.

Figure 3. Graph of the TpFN (a, b, c, d)

9. **Remark:** (*Arithmetic Operations on TFNs*) It can be shown (Kaufmann and Gupta, 1991) that the two general methods of defining arithmetic operations on FNs mentioned in Remark 5 lead to the following simple rules for the *addition* and *subtraction* of TFNs:

Let $A = (a, b, c)$ and $B = (a_p, b_p, c_p)$ be two TFNs. Then

- The sum $A + B = (a+a_p, b+b_p, c+c_p)$.
- The difference $A - B = A + (-B) = (a-c_p, b-b_p, c-a_p)$, where $-B = (-c_p, -b_p, -a_p)$ is defined to be the *opposite* of B .

In other words, the opposite of a TFN, as well as the sum and the difference of two TFNs are always TFNs. On the contrary, the *product* and the *quotient* of two TFNs, although they are FNs, they are not always TFNs, unless if a, b, c, a_p, b_p, c_p are in $\mathbf{R}^+$ (Kaufmann and Gupta, 1991).

The following two *scalar operations* can be also defined:

- $k + A = (k+a, k+b, k+c)$, $k \in \mathbf{R}$
- $kA = (ka, kb, kc)$, if $k > 0$ and $kA = (kc, kb, ka)$, if $k < 0$.

Trapezoidal Fuzzy Numbers (TpFNs)

A TpFN (a, b, c, d) with a, b, c, d in $\mathbf{R}$ represents the fuzzy statement *approximately in the interval* $[b, c]$. Its membership function $y=m(x)$ is zero

outside the interval $[a, d]$, while its graph in this interval $[a, d]$ is the union of three straight line segments forming a trapezoid with the X-axis (see Figure 3),

Therefore, the analytic definition of a TpFN is given as follows:

10. **Definition:** Let $a < b < c < d$ be given real numbers. Then the TpFN (a, b, c, d) is the FN with membership function:

$$y = m(x) = \begin{cases} \frac{x-a}{b-a} & , \quad x \in [a, b] \\ x = 1 & , \quad x \in [b, c] \\ \frac{d-x}{d-c} & , \quad x \in [c, d] \\ 0 & , \quad x < a \text{ and } x > d \end{cases}$$

It is easy to observe that the TpFNs are generalizations of TFNs. In fact, the TFN (a, b, d) can be considered as a special case of the TpFN (a, b, c, d) with $b=c$.

11. **Remark:** (*Arithmetic Operations on TpFNs*) It can be shown (Kaufmann and Gupta, 1991) that the addition and subtraction of two TpFNs are performed in the same way that it was mentioned in Remark 9 for TFNs. Also, the two scalar operations defined in Remark 9 for TFNs hold also for TpFNs.

12. **Proposition:** (*Defuzzification of a TpFN*) The coordinates (X, Y) of the COG of the graph of the TpFN (a, b, c, d) are calculated by the formulas $X = \frac{c^2 + d^2 - a^2 - b^2 + dc - ba}{3(c + d - a - b)}$, $Y = \frac{2c + d - a - 2b}{3(c + d - a - b)}$.

Proof: We divide the trapezoid forming the graph of the TpFN (a, b, c, d) in three parts, two triangles and one rectangle (Figure 3). The coordinates of the three vertices of the triangle ABE are $(a, 0)$, $(b, 1)$ and $(b, 0)$ respectively, therefore

by Proposition 8 the COG of this triangle is the point $C_1 (\frac{a+2b}{3}, \frac{1}{3})$. Similarly one finds that the COG of the triangle FCD is the point $C_2 (\frac{d+2c}{3}, \frac{1}{3})$. Also, it is easy to check that the COG of the rectangle BCFE, being the intersection point of its diagonals, is the point $C_3 (\frac{b+c}{2}, \frac{1}{2})$. Further, the areas of the two triangles are equal to $S_1 = \frac{b-a}{2}$ and $S_2 = \frac{d-c}{2}$ respectively, while the area of the rectangle is equal to $S_3 = c-b$.

Further, the coordinates of the COG of the trapezoid, being the resultant of the COGs $C_i (x_i, y_i)$, for $i=1, 2, 3$, are calculated by the formulas

$$X = \frac{1}{S} \sum_{i=1}^3 S_i x_i, Y = \frac{1}{S} \sum_{i=1}^3 S_i y_i \quad (1)$$

where $S = S_1 + S_2 + S_3 = \frac{c+d-b-a}{2}$ is the area of the trapezoid (Wikipedia, 2014).

The proof of the Proposition is completed by replacing the above found values of S, S_i, x_i and $y_i, i = 1, 2, 3$, in formulas (1) and by performing the corresponding operations.

MAIN FOCUS OF THE ARTICLE

A method is developed in this Section of using the TFNs and TpFNs as assessment tools, which is validated with the parallel use of two other traditional assessment methods, the calculation of the mean values and of the GPA index.. The examples presented concern the assessment of student and basket – ball player performance. The following definition is needed for this purpose:

13. **Definition:** Let $A_i = (a_{i1}, a_{i2}, a_{i3}, a_{i4}), i = 1, 2, \dots, n$ be TFNs (TpFNs), where n is a non negative integer, $n \geq 2$. Then we define the *mean value* of the A_i 's to be the TFN (TpFN)

$$A = \frac{1}{n} (A_1 + A_2 + \dots + A_n).$$

14. **Example:** The students of two different Departments of the School of Management and Economics of the Graduate Technological Educational Institute (T. E. I.) of Western Greece achieved the following scores (in a climax from 0 to 100) at their common progress exam in the course "Mathematics for Economists I":

First Department (D_1): 100(2 times), 99(3), 98(5), 95(8), 94(7), 93(1), 92(6), 90(5), 89(3), 88(7), 85(13), 82(6), 80(14), 79(8), 78(6), 76(3), 75(3), 74(3), 73(1), 72(5), 70(4), 68(2), 63(2), 60(3), 59(5), 58(1), 57(2), 56(3), 55(4), 54(2), 53(1), 52(2), 51(2), 50(8), 48(7), 45(8), 42(1), 40(3), 35(1).

Second Department (D_2): 100(1), 99(2), 98(3), 97(4), 95(9), 92(4), 91(2), 90(3), 88(6), 85(26), 82(18), 80(29), 78(11), 75(32), 70(17), 64(12), 60(16), 58(19), 56(3), 55(6), 50(17), 45(9), 40(6).

The student performance was characterized by the fuzzy linguistic labels (grades) A, B, C, D and F corresponding to the above scores as follows: A (85-100) = excellent, B (84-75) = very good, C (74-60) = good, D (59-50) = fair and F (<50) = unsatisfactory.

The two Departments performance will be assessed by using the two above mentioned traditional methods first and TFNs next.

- a. **Traditional Methods:** It is straightforward to calculate the mean values of the student scores of the two Departments, which are equal to 72.44 and 72.04 for D_1 and D_2 respectively. Therefore, the two Departments

demonstrated a good (C) *mean performance*, with the performance of D_1 being slightly better.

In contrast to the mean values of student scores, the *Grade Point Average* (GPA) index is a weighted average that measures the two Departments' *quality performance*, by assigning greater coefficients (weights) to the higher scores. Namely, the GPA index is calculated by the formula: GPA

$$= \frac{0n_F + 1n_D + 2n_C + 3n_B + 4n_A}{n} \quad (2) \text{ where } n$$

is the total number of students and n_A, n_B, n_C, n_D and n_F the numbers of students that demonstrated excellent (A), very good (B), good (C), fair (D) and unsatisfactory (F) performance respectively (Swinburne.edu.au, 2014).

In case of the ideal performance ($n_A = n$) formula (2) gives that GPA = 4, while in case of the worst performance ($n_F = n$) it gives that GPA = 0. Therefore, $0 \leq \text{GPA} \leq 4$, which means that values of GPA greater than 2 could be considered as indicating a more than satisfactory performance.

In our case, and in order to calculate the values of the GPA index for the two Departments, Table 1 is formed by depicting the student performance in terms of the grades A, B, C, D and F defined above.

Replacing the data of Table 1 to formula (2) and making the corresponding calculations one finds the same value $\text{GPA} = \frac{43}{17} \approx 2.53$ for the

Table 1. Student performance in terms of the linguistic labels

Grade	D_1	D_2
A	60	60
B	40	90
C	20	45
D	30	45
F	20	15
Total	170	255

two Departments that indicates a more than satisfactory quality performance.

- b. **Using TFNs:** A TFN (denoted by the same letter) is assigned to each linguistic label (grade) as follows: A = (85, 92.5, 100), B = (75, 79.5, 84), C = (60, 67, 74), D = (50, 54.5, 59) and F = (0, 24.5, 49). The middle entry of each of the above TFNs is equal to the mean value of the student scores assigned to the corresponding grade. In this way a TFN corresponds to each student assessing his (her) individual performance. The representation of the linguistic labels A, B, C, D and F by TFNs has the advantage of determining numerically the scores corresponding to each label. In fact, the scores assigned to the above labels in the statement of this Example are not standard, since they may differ from case to case. In a more rigorous assessment, for instance, one could take A(90-100), B (80-89), C(70-79), D (60-69), F(<60), etc.

It becomes now clear that Table 1 gives rise to 170 TFNs representing the progress of the students of D_1 and 255 TFNs representing the progress of the students of D_2 . Consequently, it is logical to accept that the overall performance of each Department is given by the corresponding mean value of the above TFNs (Definition 13). For simplifying our notation, let us denote the above mean values by the letter of the corresponding Department. Then, making straightforward calculations, one finds that

$$D_1 = \frac{1}{170} \cdot (60A + 40B + 20C + 30D + 20F) \approx (63.53, 71.74, 83.47), \text{ and}$$

$$D_2 = \frac{1}{255} \cdot (60A + 90B + 45C + 45D + 15F) \approx (65.88, 72.63, 79.53).$$

The left entries (63.53 and 65.88 respectively) and the right entries (83.47 and 79.53 respectively)

of the TFNs D_1 and D_2 determine approximately only the overall performance of the two Departments to be from good (C) to very good (B). Concerning the middle entries of D_1 and D_2 (71.74 and 72.63 respectively), since the middle entries of the TFNs A, B, C, D and F were chosen to be equal to the means of the scores assigned to the corresponding linguistic grades, they are simply equal to the mean values of these means and therefore they do not give a representative measure of the two Departments performance.

Applying Proposition 7 one finds that the x-cuts of the above two TFNs are $D_1^x = [63.53 + 8.21x, 83.47 - 11.73x]$ and $D_2^x = [65.88 + 6.75x, 79.53 - 6.9x]$ respectively. But $63.53 + 8.21x \leq 65.88 + 6.75x \Leftrightarrow 1.46x \leq 2.35 \Leftrightarrow x \leq 1.61$, which is true, since x is in $[0, 1]$. On the contrary, $83.47 - 11.73x \leq 79.53 - 6.9x \Leftrightarrow 3.94 \leq 4.83x \Leftrightarrow 0.82 \leq x$, which is not true for all the values of x . Therefore, according to Definition 4, the TFNs D_1 and D_2 are not comparable, which means that at this stage one can not decide which of the two Departments demonstrates the better performance.

A good way to overcome this difficulty is to defuzzify the TFNs D_1 and D_2 . By Proposition 8, the COGs of the triangles forming the graphs of the TFNs D_1 and D_2 have x-coordinates equal to $X = \frac{63.53 + 71.74 + 83.47}{3} \approx 72.91$ and $X' = \frac{65.88 + 72.63 + 79.53}{3} \approx 72.68$ respectively.

Observe now that the GOGs of the graphs of D_1 and D_2 lie in a rectangle with sides of length 100 units on the X-axis (student scores from 0 to 100) and one unit on the Y-axis (normal fuzzy sets). Therefore, *the nearer the x-coordinate of the COG to 100, the better the corresponding Department's performance*. Thus, since $X > X'$, D_1 demonstrates a (slightly) better overall performance than D_2 .

15. **Example:** The individual performance of the five players of a basket-ball team who started a game was assessed by six different athletic journalists using a scale from 0 to 100 as follows: P_1 (player 1): 43, 48, 49,

49, 50, 52, P_2 : 81, 83, 85, 88, 91, 95, P_3 : 76, 82, 89, 95, 98, P_4 : 86, 86, 87, 87, 87, 88 and P_5 : 35, 40, 44, 52, 59, 62. The players' performance is characterized by the fuzzy linguistic labels A, B, C, D and F defined in Example 14.

Here the five players' overall performance will be assessed by using the above mentioned two traditional methods first and also by using TFNs and TpFNs next.

a. **Traditional Methods:** Adding the $5 * 6 = 30$ in total scores assigned to the players by the journalists and dividing the corresponding sum by 30 one finds that the *mean performance* of the five players is approximately equal to 60.05, i.e. it can be marginally characterized as good (C).

Further, it can be observed that 14 of the above, 30 in total, scores correspond to the label A, four to B, one to C, four to D and seven to F. Replacing these values to formula (2) one finds that the GPA index is approximately equal to 2.47. Therefore, the five players' overall quality performance is characterized as more than satisfactory.

b. **Using TFNS:** Working as in Example 14, one forms the TFNs A, B, C, D and F. Further, observing the $5 * 6 = 30$ in total player scores it becomes clear that 14 of them correspond to the TFN A, four to B, one to C, four to D and seven to F.

The mean value of the above TFNs (Definition 13) is equal to $M = \frac{1}{30} (14A + 4B + C + 4D + 7F) \approx (58.33, 68.98, 79.63)$. Therefore, the players' overall performance lies in the interval $[58.33, 79.63]$, i.e. it could be characterized from fair (D) to very good (B).

Further, defuzzifying the TFN M (Proposition 8) one finds the value 68.98 for the x-coordinate of the COG of its graph, which finally shows that

the five players demonstrated a good (C) overall performance.

- c. **Using TpFNs:** A TpFN (denoted, for simplicity, by the same letter) is assigned to each basket-ball player P_i as follows: $P_1 = (0, 43, 52, 59)$, $P_2 = (75, 81, 95, 100)$, $P_3 = (75, 76, 98, 100)$, $P_4 = (85, 86, 88, 100)$ and $P_5 = (0, 35, 62, 74)$. Each of the above TpFNs describes numerically the individual performance of the corresponding player in the form (a_1, a_2, a_3, a_4) , where a_1 and a_4 are the lower and upper bounds respectively of his performance with respect to the linguistic labels A, B, C, D and F, while a_2 and a_3 are the lower and higher scores respectively assigned to the corresponding player by the athletic journalists. The mean value of the TpFNs P_i , $i = 1, 2, 3, 4, 5$ (Definition 13), is equal to

$P = \frac{1}{5} \sum_{i=1}^5 P_i = (47, 64.2, 79, 86.6)$, which gives the following information:

- The players' performance, is fluctuated from unsatisfactory ($a_1=47$) to excellent ($a_4=86.6$).
- The overall players' performance is lying in the interval $[a_2, a_3] = [64.2, 79]$, i.e. it can be characterized from good (C) to very good (B).

Further, defuzzifying the TpFN P (Proposition 12) one finds the value

$$\frac{79^2 + (86.6)^2 - (64.2)^2 - 47^2 + 79 * 86.6 - 47 * (64.2)}{3(79 + 86.6 - 47 - 64.2)} \approx 68.84$$

for the x-coordinate of the COG of its graph, which finally shows that the five players demonstrated a good (C) overall performance.

SOLUTIONS AND RECOMMENDATIONS

The outcomes obtained from the application of the four in total assessment methods used in our Examples are depicted in Tables 2 and 3. The data of these Tables show that the outcomes of the two new fuzzy assessment methods (TFNs/TpFNs) are compatible to the corresponding outcomes of the two traditional assessment methods (mean values / GPA index). This is a strong indication that the two fuzzy methods “behave” well (validation of the fuzzy methods), which was also crossed with different problems in earlier author's works (Voskoglou, 2015, etc.). The small numerical differences appeared are due to the different “philosophy” of the four methods (mean and quality performance, bi-valued and fuzzy logic).

The approximation of the overall player performance obtained in the first step of case iii of Example 15 (good to very good) is better than that obtained in the first step of case ii (fair to very good), because the TpFNs, due to the way of their construction, measure more accurately than the TFNs the player performance. However, it is not always easy in practice to use TpFNs instead of TFNs. In Example 14, for instance, there are

Table 2. Outcomes of experiment 14

Method	D_1	D_2	Performance
Mean values	72.44	72.04	Good (C)
GPA index	2.53	2.53	More than satisfactory
TFNs	72.91	72.68	Good (C)

Table 3. Outcomes of experiment 15

Method		Performance
Mean values	60.05	Good (C)
GPA index	2.47	More than satisfactory
TFNs	68.98	Good (C)
TpFNs	68.84	Good (C)

$170+255=425$ students under assessment, which means that one has to form a great number of TpFNs for evaluating their performance, resulting to laborious calculations.

Another advantage of using TpFNs as assessment tools is that they enable, in contrast to TFNs, the comparison of the individual performance of any two persons. In case iii of Example 15, for instance, it is enough to defuzzify the TpFNs P_i , $i=1, 2, 3, 4, 5$ corresponding to the players' individual performance, as we did for P and to apply the same comparison criterion.

FUTURE RESEARCH DIRECTIONS

The new method of using TFNs/TpFNs for student and basket-ball player assessment developed here has the potential of a general assessment method. This means that it could be utilized for assessing a great variety of other human or machine (e.g. Case – Based Reasoning or Decision – Making systems) activities. This is the main target of our future research on the subject.

CONCLUSION

In the present paper a combination of TFNs / TpFNs and of the COG defuzzification technique was used for assessing human skills. Examples for student and basket-ball player assessment were presented illustrating the results obtained and the new fuzzy assessment method was validated by comparing its outcomes in these examples with the corresponding outcomes of two traditional assessment methods, the calculation of the mean values and of the GPA index. The main advantage of the new fuzzy method with respect to the traditional ones is that, due to the FL's property of characterizing the ambiguous assessment situations with multiple values, it fits better to such kind of situations.

KEY TERMS AND DEFINITIONS

Centre of Gravity (COG) Defuzzification Technique: A defuzzification technique in which the corresponding system's fuzzy outputs are represented by the coordinates of the COG of the level's section contained between the graph of the membership function involved and the OX axis. The COG technique can be used, under a proper manipulation, as an assessment method of the fuzzy system's quality performance.

Defuzzification: The process of representing a system's fuzzy outputs by a crisp number.

Grade Point Average (GPA): A weighted average assigning greater coefficients (weights) to the higher scores and therefore focusing on a system's quality performance.

Fuzzy Arithmetic: The extension of the four classical arithmetic operations of crisp numbers to fuzzy numbers.

Fuzzy Assessment Methods: Assessment methods based on the principles of fuzzy logic.

Fuzzy Logic (FL): A logic based on the concept of fuzzy set that, in contrast to the classical bi-valued logic (yes – no), characterizes a case with multiple values.

Fuzzy Number (FN): A fuzzy set A on the set R of real numbers which is *normal* (i.e. there exists x in R such that $m_A(x) = 1$) and *convex* (i.e. all its α -cuts $A^\alpha = \{x \in U: m_A(x) \geq \alpha\}$, α in $[0, 1]$, are closed real intervals) and whose membership function $y = m_A(x)$ is a piecewise continuous function.

Fuzzy Set (FS): A generalization of the concept of crisp set that gives a mathematical formulation to real situations in which certain definitions have not clear boundaries (e.g. the high mountains of a country). A FS, say A , is characterized by a membership function $y = m_A(x)$ defined on the universal set of the discourse U and taking values in the interval $[0, 1]$, thus assigning to each element x of U a membership degree $m_A(x)$ with respect to A . The closer is $m_A(x)$ to 1, the better x satisfies the characteristic property of A .

Trapezoidal Fuzzy Number (TpFN): A fuzzy number whose membership function's graph forms a trapezoid with the OX-axis. The TpFNs are generalizations of the triangular fuzzy numbers.

Triangular Fuzzy Number (TFN): The simplest form of a fuzzy number, whose membership function's graph forms a triangle with the OX-axis.

INTRODUCTION

Soft set theory is a new mathematical approach to handle uncertainty based problems. It was introduced in (Molodtsov, 1999). Later on, fuzzy soft sets is defined in (Maji et al. 2001) and provided an application of soft set theory in decision-making problems (Maji et al., 2002). There are several theories which deal with vagueness and ambiguity. Some of these are: probability theory, interval mathematics and fuzzy set theory. All these models have their own drawbacks; such as fuzzy sets (Zadeh, 1965) are completely dependent on membership functions. There is no unique formula to define membership functions. Molodtsov observed that the main reason of these drawbacks is perhaps due to the inadequacy of parameterization tools. That led him to introduce soft set theory, which is a parameterized collection of subsets.

Game theory is defined as the mathematical model of interaction between rational, intelligent decision makers. In this chapter, we mention how game theory and soft sets are related. When we handle real life situations, we can observe that most of the information available is ambiguous or uncertain. Now a days, in most of the games we need to create human models or human behaviour. There exist a lot of approaches to describe human

behavior in game theory. Some of them are pay function, choice functions etc. Molodtsov has introduced s-function (soft function) which keeps all good sides of choice function and eliminates the drawbacks of pay function and choice functions (Molodtsov, 1999). Deli and Cagman has studied further to associate soft set theory in game theory (Deli et al., 2013).

This chapter is further organized into ten sections. The next section contains definitions and notions of soft set theory. In the section three we have given some descriptions about the game theory. In the section four we have provided classification of games. Section five illustrates the representation of games in some subsections subsequently. In section six the definitions and notions related to both game theory and soft set theory are discussed. Section seven provides the definitions and notions about soft sets in decision making. In the section eight we provided the soft sets in decision making based on game theory which further describes about two-person soft game and n-person soft game under the subsections subsequently. Section nine provides future scope of this research work. Finally provide conclusions drawn from our research work. The chapter ends with a bibliography of sources referred for the compilation of our work.

BACKGROUND

Soft set is a parameterized family of subsets defined over a universe associated with a set of parameters.

The definition of soft set is given below.

Definition 1 (Molodtsov, 1999): A pair (F, E) is called a soft set over U iff F is a mapping of E into the set of all subsets of the universal set U ; i.e.

$$F: E \rightarrow P(U) \quad (1)$$

where U is the universal set, E is the parameter set and $P(U)$ is the power set U .

In other words, a soft set over U is a parameterised family of subsets of the universe U . For $e \in E$, $F(e)$ can be called as the set of e -approximate elements of the soft set (F, E) . So, a soft set can be represented as a collection of approximations. The parameter part of the approximation is called as predicate and for each parameter in E and the set containing all the elements of $F(e)$ is called the value set of e in (F, E) .

The pair (U, E) is often regarded as a soft universe. A parameter can be anything adverbial for the elements, such as a number, word, phrase or a sentence which can describe the value set more appropriately.

The way of describing an object in soft set theory differs principally from the way an object is described in classical mathematics. Normally, in classical mathematics a mathematical model of an object is constructed to define the notion of the exact solution of that model. Sometimes the mathematical model becomes too complicated to find the exact solution. So, we need the notion of approximate solution to get rid of these types of problems. However, in soft set theory, we are getting the solution to the problems by the opposite approach. The description of the object will have an approximate nature initially and so that we do not need to use the notion of exact solution.

There are no restrictions on the approximate description of the objects in soft set theory, which makes this model very convenient and can be easily applied in real life problems. We can use any type of parameterisation depending upon the preferences with the help of words and sentences, mappings, functions, real numbers, and so on.

Definition 2 (Maji et al., 2001): The pair (F, E) can be called as a fuzzy soft set over U , where F is a mapping given by

$$F: A \rightarrow I^U \quad (2)$$

where U is the initial universal set, E is the set of parameters, I^U is the power set of all fuzzy subsets of U and $A \subseteq E$.

For any element of E , the possible number of degrees of belongingness are real numbers lying in the interval of $[0, 1]$ and hence infinite.

GAME THEORY

Game theory was introduced in (Von Neumann, 1944). Neumann is also known as the father of game theory. Game theory is a type of decision theory in which one's choice of action is determined after taking into account all possible alternatives available to an opponent playing the same game, rather than just by the possibilities of several outcomes.

In this section we discuss about strategic form games, the representation of games and the classification of games. Strategic form games are also called normal game forms.

Definition 3 (Strategic Form Games): A strategic form game ' Γ ' is a 3-tuple $\langle N, S_i, u_i \rangle$ where $i \in N$, N is the finite set of players, i.e., $N = \{1, 2, \dots, n\}$. S_i 's are the strategy sets of players and

$$u_i : S_1 \times S_2 \times \dots \times S_{n-1} \times S_n \rightarrow \mathbb{R}$$

for $i=1, 2, \dots, n$ are mappings called the utility functions or payoff functions.

The strategies are also called actions or pure strategies. Denoting the Cartesian product $S_1 \times S_2 \times \dots \times S_n$ by S , we have S is the collection of all strategic profiles of the players. The utility of an agent depends not only on its own strategy but also strategy of the rest of the players.

Notions Used in Game Theory

In this section we provide some of the concepts and notations to be used in this chapter.

Utilities

Utility theory is the science of assigning numbers to outcomes in a way that captures the preferences of the players. In any game, utility represents the motivation of players. A utility function for a given player assigns a number for every possible outcome of the game with the property that a higher number implies that the outcome is more preferred. Von Neumann and Morgenstern stated and proved expected *utility maximization theorem* in (Neumann et al., 1944), which establishes that for any rational decision maker that there must exist a way of assigning utility numbers to different outcomes in a way that the decision maker would always choose the option that maximizes his expected utility.

Intelligence

Intelligence is another notion that we use in game theory. This notion connotes that each player in the game knows everything about the game that a game theorist knows, and the player is competent enough to make any inferences about the game that a game theorist can make.

Common Knowledge

The definition of common knowledge as follows: A fact is the common knowledge among the players if every player knows it, every player knows that every player knows it, and so on. That is, every statement of the form “every player knows that every player knows that ... every player knows it” is true and infinitum. (Aumann, 1976)

Bounded Reality

In (Osborne et al., 1994), the concept of bounded rationality is given as “Game theory, in its most common form, assumes that all the players are symmetric; that is, they have identical capabilities of perception and computation. It does not model asymmetries in abilities or perceptions of situations.”

CLASSIFICATION OF GAMES

In this section we provide the broad categories into which Games can be classified. These are,

1. **Non-Cooperative Games and Cooperative Games:** Non cooperative games are those in which the actions of individual players are the primitives. In cooperative games, joint actions of group of players are the primitives.
2. **Games With Perfect Information and Games with Imperfect Information:** If the player is having full information about the past history of the game, the game is said to be of perfect information. Otherwise game is said to be of imperfect information.
3. **Games With Complete Information and Incomplete Information:** A game with complete information is one in which, at the first point in time when the players can begin to plan their moves, some players have private information about the game that other players don't know.

REPRESENTATION OF GAMES

The primary categorization of games is that of cooperative and non cooperative games. Most of the cooperative games are represented by using characteristic function form, while the extensive and the normal forms are used to define non cooperative games. These forms are explained in the following sections.

Extensive Form

The extensive form can be used to formalize games with a time sequencing of moves. Games here are played on trees. An example is shown below.

In the game tree representation, there are three types of nodes.

1. Root node (initial decision node)
2. Decision node (which are internal nodes)
3. Terminal nodes (Leaf nodes).

When the game actually takes place, the path that represents the sequence of events is called the path of play. Each decision node is labeled with the player who takes a decision at that node. The links that are outgoing at the decision node are labeled with the actions the player may select at that node. Here each vertex or node represents a point of a choice for a player. A player is specified by a number listed by the vertex. The lines out of the vertex represent a possible action for that player. The payoffs are specified at the bottom of the tree. The extensive form can be viewed as a multi-player generalization of a decision tree.

Figure 1. An extensive form game

The extensive form can also capture simultaneous-move games and games with imperfect information. To represent it, either a dotted line connects different vertices to represent them as being part of the same information set (i.e. the players do not know at which point they are), or a closed line is drawn around them.

Normal Form

The normal (Strategic form) game is usually represented by a matrix which shows the players, strategies and payoffs. It can be represented by any function that associates a payoff for each player with every possible combination of actions. Suppose there are two players, one chooses the row and the other chooses the column. Each player has two strategies which are specified by the number of columns and number of rows. The first number is the payoff received by the row player (player 1), second number is the payoff received for the column player (player 2). Suppose that Player 1 plays Up and that Player 2 plays Left. Then Player 1 gets a payoff of 4, and Player 2 gets 3. When a game is presented in normal form, it is presumed that each player acts simultaneously or, at least, without knowing the actions of the other. If players have some information about the choices of other players, the game is usually presented in extensive form.

Characteristic Function Form

In games that possess removable utility separate rewards are not given; rather, the characteristic function decides the payoff of each unity.

Table 1. Normal form game

	Player 2 Chooses Left	Player 2 Chooses Right
Player 1 Chooses Up	4, 3	-1, -1
Player 1 Chooses Down	0, 0	3, 4

The origin of this form is to be found in John von Neumann and Oskar Morgenstern's book; when looking at these instances, they guessed that when a union C appears, it works against the fraction (N/C) as if two individuals were playing a normal game. The balanced payoff of C is a basic function. Although there are different examples that help to determine coalitional amounts from normal games, not all appear that in their function form can be derived from such. Formally, a characteristic function is seen as: (N, v) , where N represents the group of people and $v: 2N \rightarrow R$ is a normal utility. Such characteristic functions have expanded to describe games where there are no removable utilities.

In (Molodtsov, 1991) the concept of optimality principles is defined as a person's mathematical model instead of payoff function. Optimality principle is stated as "An optimal policy has the property that whatever the initial state and initial decision are the remaining decision must constitutes an optimal policy with regard to the state resulting from the first decision". Optimality principle is considered as the generalization of choice function. Choice function is a mapping which associates a set of strategies with a given situation.

GAME THEORY AND SOFT SETS

In this section, we discuss how soft sets are related with game theory. Molodtsov discussed some

applications of soft sets (Molodtsov, 1999). Among these applications, he mentioned how soft sets are related with game theory and operations research. There are a lot of ways to describe human behaviour in game theory. Normally we use payoff function for modeling human behaviour. Payoff function for a player is a mapping from the cross-product of players strategy spaces to the players set of payoffs. i.e., payoff function of a player takes as its input as a strategy profile and yields a representation of payoffs as its output. But the construction of the pay function is a difficult problem. As we have mentioned earlier, there are some strategies which match according to the situations. From these available strategies, we have to choose the best possible solution for each situation. A mapping which associates a set of strategies with a given situation is called choice function. But it has some constraints. The choice function cannot give appropriate description of various compromises and concessions which are typical for such problems. Soft set theory gives an opportunity to construct a new mathematical tool which keeps all good sides of choice function and eliminates its drawbacks. Here, soft set means to point out different strategies of each and every player. Molodtsov has suggested the concept of a s-function. For any set of strategies there exists a set ϵ of optimal choices and the user has to select suitable s-functions for describing human's behaviour under uncertainty. But the question is: which s-function has to be chosen for describing human behaviour?

Table 2. Symbols used

Symbols	Meaning
n	The number of players
S_i	The set of strategies of player 'i'
E	The set of parameters of player 'i'
$M(S)$	The set of all sub sets of the set S
$(F_i, E_i) : M(S) \rightarrow S, (F_i, E_i)$	soft choice function for player 'i'

Molodtsov introduced some approaches to this problem for different types of uncertainties. He has given a formal definition of the game with s -function for modeling a person's behaviour. The important symbols used are shown in Table 2.

If $P \subset S$, that is, P is a subset of admissible strategies and ε is a parameter, $\varepsilon \in E_i$, then $F_i(P, \varepsilon)$ is a set of ε -optimal situations for player 'i'. This type of games are said to be in a normal form with the following notation.

$$\langle (F_i, E_i), S_i, i = 1, \dots, n \rangle.$$

In game theory, Nash equilibrium is a concept to find out the solution of a non cooperative game involving two or more players. Here, each player is assumed to know the equilibrium strategies of the other players and no other player has anything to gain by changing their own strategy. If a player has chosen a strategy and no player can benefit by changing strategies while the other players keep their plans unchanged, then the current set of strategy choices and their corresponding payoffs constitutes a Nash equilibrium.

For a soft game to be in normal form, the analogue of the Nash equilibrium is the following construction.

Definition 4: A Situation $s \in S$ is called a situation of soft-equilibrium $\varepsilon = (\varepsilon_1, \dots, \varepsilon_n)$, $\varepsilon_i \in E_i$, if and only if

$$s \in F_i(s_1 \times \dots \times s_{i-1} \times S_i \times s_{i+1} \times \dots \times s_n, \varepsilon_i),$$

for every $i=1,2,\dots,n$. The set of all situations of soft ε -equilibrium is denoted by $N(\varepsilon)$. Then the soft set $(N, E_1 \times \dots \times E_n)$ is called a soft equilibrium. The soft guarantee concept is discussed below.

Suppose if there is only one player and

X is the set of strategies of the player,

E is the set of parameters of the player,

S is the set of situations.

$(F, E): M(S) \rightarrow S$ is a soft choice function of the player.

Point set mapping is a mapping that associates a number of different number of elements of the second set with the same element of the first. Let π be a point set mapping

$$\pi : X \rightarrow M(S) \quad (3)$$

The player knows that if he chooses the strategy $x \in X$, then he will get one of the situations, $s \in \pi(x)$. Consider the soft set $(\text{Gar}F, E)$, where

$$\begin{aligned} \text{Gar}F(X, \varepsilon) &= \{x \in X \mid \pi(x) \subset F(\pi(x), \varepsilon)\}, \\ \pi(x) &= \bigcup_{x \in X} \pi(x) \end{aligned} \quad (4)$$

is a soft guarantee concept. Here, the notion of Stackelberg solution is applied to the soft sets. Suppose there are two players in normal form

$$\langle (F_i, E_i), S_i, i = 1, 2 \rangle.$$

Stackelberg leadership model is a strategic game in economics in which the leading firm moves first and then the follower firms move sequentially.

Player 1 makes the first move. He chooses one strategy $s_1 \in S_1$ and inform player 2 about his choice. Since player 2 knows the strategy s_1 , he chooses his strategy $s_2 \in S_2$ so that

$$(s_1, s_2) \in F_2(s_1 \times s_2, \varepsilon_2).$$

It is assumed that player 1 knows the value of the parameter $\varepsilon_2 \in E_2$. Player 1 considers uncertain the possible choices of player 2. Applying guarantee concept, we will get soft Stackelberg set $(St_1, E_1 \times E_2)$ for player 1, where

$$St_1(S_1 \times S_2, \varepsilon_1, \varepsilon_2) = \{s_1 \in S_1 \mid F_2(s_1 \times S_2, \varepsilon_2) \subset F_1(S_1 \times S_2, \varepsilon_1)\} \quad (5)$$

SOFT SETS IN DECISION MAKING

An application of soft sets in decision making theorem is given in (Maji et al, 2002). In game theory, players have to take decisions according to the situations they face. So, we can use the decision making concept in game theory to take a particular strategy which suits to the situation.

Definition 5: Comparison table of a fuzzy soft set (F, P) is a square table in which number of rows and number of columns is equal. Rows and columns both are labeled by the object names $s_1, s_2, \dots, s_n$ of the universe, and the entries are c_{ij} where c_{ij} represents the number of parameters for which the membership value of h_i exceeds or equal to the membership value of h_j . Clearly, $0 \leq c_{ij} \leq k$ and $c_{ii} = k, \forall i, j$ where k is the number of parameters in P.

Definition 6: Row sum of an object 'h' is denoted by ' r_i ' and is calculated by using the formula

$$r_i = \sum_{j=1}^n c_{ij} \quad (6)$$

Here r_i , indicates the total number of parameters in which h_i dominates all the members of U.

Column sum of an object h_j is denoted by t_j and is calculated by using the formula

$$t_j = \sum_{i=1}^n c_{ij} \quad (7)$$

Definition 7: Score of an object h_j is denoted by

$$t_j \text{ and is calculated by using the formula } S_i = r_i - t_i.$$

The following algorithm is used to select a suitable strategy Mr. X would like to play.

Algorithm 1:

Step 1: Input the fuzzy soft set (F, E).

Step 2: Input the set P of choice parameters of Mr. X which is a subset of E.

Step 3: Consider the fuzzy soft set (F,P) and we write in tabular form.

Step 4: Compute the comparison table of fuzzy soft set (F,P).

Step 5: Compute r_i and t_i for $h_i, \forall i$.

Step 6: Compute the score of $h_i \forall i$.

Step 7: Find $S_i = \max S_i$. Then Mr. X can choose the strategy ' s_i '.

Consider a fuzzy soft set (F, E). Suppose that $P = \{e_1, e_2, e_3, e_4\}$ is the set of choice parameters for Mr. X on the basis of which he wants to choose a strategy from the availability U. Let $s_1, s_2, \dots$ denote the strategies. Tabular representation of the fuzzy soft set (F, P) is shown in Table 3.

The comparison-table of the fuzzy soft set shown in Table 3 is computed and shown in Table 4.

Next, we need to compute row-sum, column sum, score for each ' s_i ' as shown in the Table 5.

In Table 5, the maximum score is 13, scored by the strategy ' s_3 '. From this, we can decide that player X can choose s_3 . In case, he doesn't want to choose ' s_3 ' due to certain reasons, his second choice will be ' s_1 '.

Table 3. Representation of Fuzzy Soft Set

U	e_1	e_2	e_3	e_4
s_1	1.0	0.2	1.0	1.0
s_2	0.4	0.3	0.0	0.1
s_3	1.0	1.0	1.0	0.5
s_4	0.4	1.0	0.2	0.3
s_5	0.6	1.0	1.0	0.2
s_6	0.8	0.0	0.2	0.3

Table 4. Comparison table for the Fuzzy Soft Set (F, P)

U	s ₁	s ₂	s ₃	s ₄	s ₅	s ₆
s ₁	4	3	3	3	3	4
s ₂	1	4	0	1	0	1
s ₃	3	4	4	4	4	4
s ₄	1	4	1	4	2	3
s ₅	2	4	2	3	4	2
s ₆	0	3	0	3	2	4

Table 5. Computation of Row-Sum, Column-Sum and Score for each 's_i'

U	Row-Sum(r _i)	Column-Sum(t _j)	Score(S _i)
s ₁	20	11	9
s ₂	7	22	-15
s ₃	23	10	13
s ₄	15	18	-3
s ₅	17	15	2
s ₆	12	18	-6

SOFT SETS IN DECISION MAKING BASED ON GAME THEORY

Soft games can be applied to problems contain vagueness and uncertainties. The following sections discuss two-person soft games and n-person soft games.

Two Person Soft Games

This was introduced by Deli and Cagman (2013). They created two person soft games with the help of soft payoff functions.

Definition 8: Let U be a set of attributes, P(U) be the power set of U, X, Y are a set of strategies. Then, a set valued function

$$f_s : X \times Y \rightarrow P(U) \quad (8)$$

is called a soft payoff function. For each $(x, y) \in X \times Y$, the value $f_s(x, y)$ is called a soft payoff.

Definition 9: Let X and Y be a set of strategies of player 1 and player 2, U be a set of alter-

natives and $f_{s_k} : X \times Y \rightarrow P(U)$ be a soft payoff function for player k, where $k=1, 2$. Then for each player k, a two person soft game (tps-game) is defined by a soft set over U as

$$S_k = \{((x, y), f_{s_k}(x, y)) : (x, y) \in X \times Y\} \quad (9)$$

The tps-game is played as follows: at a certain time Player 1 chooses a strategy $x_i \in X$, simultaneously Player 2 chooses a strategy $y_j \in Y$ and once this is done each player k receives the soft payoff $f_{s_k}(x_i, y_j)$.

If $X=\{x_1, x_2, \dots, x_m\}$ and $Y=\{y_1, y_2, \dots, y_n\}$, then the soft payoffs of S_k can be arranged in the form of the $m \times n$ matrix shown in Table 6.

Let's consider an example. Let $U=\{u_1, u_2, \dots, u_{10}\}$ be a set of alternatives, P(U) be the power set of U, $X=\{x_1, x_3, x_5\}$ and $Y=\{x_1, x_2, x_4\}$ be the set of strategies of Player 1 and 2 respectively. If player 1 constructs a tps-game as shown in Box 1.

Then the soft payoffs of the game can be arranged as in Table 7.

Box 1.

$$s_1 = \left\{ \begin{aligned} &((x_1, x_1), \{u_1, u_2, u_5, u_8\}), (x_1, x_2), \{u_1, u_2, u_3, u_4, u_4, u_8\}), (x_1, x_4), \{u_3, u_8\}), \\ &(x_3, x_1), \{u_1, u_3, u_7\}), (x_3, x_2), \{u_1, u_2, u_3, u_5, u_6, u_7\}), (x_3, x_4), \{u_1, u_2, u_3\}), \\ &(x_5, x_1), \{u_3, u_4, u_5, u_8\}), (x_5, x_2), \{u_1, u_2, u_3, u_4, u_5, u_6, u_7, u_8\}), (x_5, x_4), \{u_1, u_2, u_3, u_8\}) \end{aligned} \right\}$$

Table 6. The two person soft game

S_k	y_1	y_2	...	y_n
x_1	$f_{s_k}(x_1, y_1)$	$f_{s_k}(x_1, y_2)$	...	$f_{s_k}(x_1, y_n)$
x_2	$f_{s_k}(x_2, y_1)$	$f_{s_k}(x_2, y_2)$	...	$f_{s_k}(x_2, y_n)$
$\vdots$	$\vdots$	$\vdots$	$\vdots$	$\vdots$
x_n	$f_{s_k}(x_m, y_1)$	$f_{s_k}(x_m, y_2)$	...	$f_{s_k}(x_m, y_n)$

If Player 1 selects x_3 and player 2 select x_2 , then the value of the game will be a set $\{u_1, u_2, u_3, u_5, u_6, u_7\}$, that is,

$$fs_1(x_3, x_2) = \{u_1, u_2, u_3, u_5, u_6, u_7\}$$

In this case, player 1 wins the set of alternatives $\{u_1, u_2, u_3, u_5, u_6, u_7\}$ and player 2 lost the same set of alternatives. Suppose, if the player 2 constructs a tps-game as shown in Box 2.

Then the soft payoffs of the game can be arranged as in Table 8.

If Player 1 select x_3 and player 2 select x_2 , then the value of game will be a set $\{u_4, u_8\}$, That is

$$fs_2(x_3, x_2) = \{u_4, u_8\}$$

In this case, Player 1 wins the set of alternatives $\{u_4, u_8\}$ and player2 lost $\{u_4, u_8\}$.

N-Person Soft Games

In two person games, only two are participating. But in some games, more than two people are participating. This has led to the concept of n-person games. So, two person games can be extended to n person soft games.

Definition 10: Let U be a set of alternatives, $P(U)$ be the power set of U and X_k is the set of strategies of Player k , ($k=1,2,\dots,n$). Then, for each player, an n-person soft game (nps-game) is defined by a soft set over U as shown in Box 3, where fs_k^n is a soft payoff function of Player k .

Box 2.

$$s_1 = \left\{ ((x_1, x_1), \{u_3, u_4, u_6, u_7\}), (x_1, x_2), \{u_6, u_7\}), (x_1, x_4), \{u_1, u_2, u_4, u_5, u_6, u_7\}), \right. \\ \left. (x_3, x_1), \{u_2, u_4, u_5, u_6, u_8\}), (x_3, x_2), \{u_4, u_8\}), (x_3, x_4), \{u_4, u_5, u_6, u_7, u_8\}), \right. \\ \left. (x_5, x_1), \{u_1, u_2, u_6, u_7\}), (x_5, x_2), \{u_7\}), (x_5, x_4), \{u_4, u_5, u_6, u_7\}) \right\}$$

Box 3.

$$S_k^n = \{((x_1, x_1, \dots, x_n), fs_k^n(x_1, x_2, \dots, x_n)) : (x_1, x_2, \dots, x_n) \in X_1 \times X_2 \times \dots \times X_n\}$$

Table 7. Soft Payoff of the Game for strategy one

S_1	x_1	x_2	x_4
x_1	$\{u_1, u_2, u_3, u_8\}$	$\{u_1, u_2, u_3, u_4, u_5, u_8\}$	$\{u_3, u_8\}$
x_3	$\{u_1, u_3, u_7\}$	$\{u_1, u_2, u_3, u_5, u_6, u_7\}$	$\{u_1, u_2, u_3\}$
x_5	$\{u_3, u_4, u_5, u_8\}$	$\{u_1, u_2, u_3, u_4, u_5, u_6, u_8\}$	$\{u_1, u_2, u_3, u_8\}$

The nps-game is played as follows: at a certain time Player 1 chooses a strategy $x_1 \in X_1$ and simultaneously each Player k ($k=2, \dots, n$) chooses a strategy $x \in X_k$ and once this is done each player k receives the soft payoff $fs_k^n(x_1, x_2, \dots, x_n)$.

Definition 11: Let

$$S_k^n = \left\{ ((x_1, x_1, \dots, x_n), fs_k^n(x_1, x_2, \dots, x_n)) : (x_1, x_2, \dots, x_n) \in X_1 \times X_2 \times \dots \times X_n \right\}$$

be an nps-game. Then, a strategy $x \in X_k$ is called a soft dominated to another strategy $x \in X_k$, if

$$\begin{aligned} fs_k^n(x_1, \dots, x_{k-1}, x_k, x_{k+1}, \dots, x_n) &\supseteq \\ fs_k^n(x_1, \dots, x_{k-1}, x_k, x_{k+1}, \dots, x_n) &\end{aligned} \quad (10)$$

For each strategy $x_i \in X_i$ of player i ($i=1, 2, \dots, k-1, k+1, \dots, n$), respectively.

FUTURE RESEARCH DIRECTIONS

There may be some situations where we need to create objects having same attributes. This can be achieved by incorporating multiset theory with fuzzy soft set and game theory. So, a model can be developed with the capabilities of game theory, fuzzy set, soft set, multiset theory. In fact the research in the direction of application of soft sets in game theory has not been explored much. But as explained in this chapter it has great potential.

Table 8. Soft Payoff of the Game for strategy two

S_2	x_1	x_2	x_4
x_1	$\{u_3, u_4, u_6, u_7\}$	$\{u_6, u_7\}$	$\{u_1, u_2, u_4, u_5, u_6, u_7\}$
x_3	$\{u_2, u_4, u_5, u_6, u_8\}$	$\{u_4, u_8\}$	$\{u_4, u_5, u_6, u_7, u_8\}$
x_5	$\{u_1, u_2, u_6, u_7\}$	$\{u_7\}$	$\{u_4, u_5, u_6, u_7\}$

So, one can try to develop the concepts already in existence or introduce new directions.

CONCLUSION

Game theory deals with any competitive situation and the models are mostly of uncertain nature. Even under this, lack of sufficient number of parameters is a big hurdle which is efficiently handled by soft set theory. In this chapter our focus was to introduce both the topics in brief and mainly deal with applications of soft set theory in achieving better solutions in handling games. Soft set theory gives an opportunity to construct a new mathematical tool which keeps all good sides of choice function and eliminates its drawbacks. We proposed some directions for further research also.

KEY TERMS AND DEFINITIONS

Choice Function: Choice function is a mapping which associates a set of strategies with a given situation.

Fuzzy Set: Fuzzy sets are an extension of the classical notion of sets whose elements have degrees of membership.

Game Theory: The study of mathematical models of conflict and cooperation between intelligent rational decision-makers.

Nash Equilibrium: It is a concept to find out the solution of a non cooperative game involving two or more players in game theory.

Payoff Function: Payoff function is used for modeling human behavior. Payoff function for a player is a mapping from the cross-product of players strategy spaces to the players set of payoffs.

S-Function (Soft Function): It is a payoff function defined using notion of soft set.

Soft Game: A game using soft payoff functions.

Soft Set: Soft set is a parameterized family of subsets defined over a universe associated with a set of parameters.

Application of Gamification to Blended Learning in Higher Education

Kamini Jaipal-Jamani

Brock University, Canada

Candace Figg

Brock University, Canada

INTRODUCTION

Digital games have been identified as a teaching strategy that goes beyond conventional notions of pedagogy to create learning environments that feel “new, meaningful, and 21st century” (Johnson, Adams, Becker, Estrada, & Freeman, 2015, p. 34). The motivational aspects of games make them highly applicable in higher education to foster student engagement in learning (Connolly, E.A. Boyle, MacArthur, Hainey, & J.M. Boyle, 2012). However, a recent review shows that digital games are not being utilised to their potential in educational settings (Boyle et al., 2016). Research shows that the inclusion of digital game-based learning (DGBL) is often challenging for educators to implement in formal education learning environments (Faria & Wellington, 2004; Ritzhaupt, Gunter, & Jones, 2010; Van Eck, 2015). This chapter proposes the use of gamification in a blended learning environment as a low-risk strategy to promote more widespread use of DGBL in higher education courses. While gamification is an emerging strategy with many definitions associated with it, there is consensus that it involves “the integration of game elements, mechanics, and frameworks into non-game situations and scenarios” (Johnson, Adams, Becker, Estrada, & Freeman, 2013, p. 20). In this chapter, the relevant literature on blended learning, gaming, and gamification are reviewed, and an empirical case is presented, to illustrate the application of gamification to blended learning in higher educa-

tion. The design and implementation of a gamified blended course are discussed and future research directions are proposed.

BACKGROUND

Blended Learning

A current trend in higher education is the implementation of blended learning (Halverson, Graham, Spring, Drysdale, & Henrie, 2014; Johnson et al., 2015). According to Graham (2013, p. 334), blended learning is commonly used to “denote a combination of traditional face-to-face and online instruction.” Blended learning evolved from the research into effective teaching practices in higher education which indicated that teacher-directed, lecture-style instruction prominent in higher education learning environments often resulted in “surface-learning” of content (Marton & Saljo, 1976). Deep and meaningful learning promotes metacognitive and higher order thinking skills which are supported by learning strategies such as collaborative tasks, engagement in discourse, reflection, and self-regulated learning (Garrison & Vaughan, 2008). Nonetheless, it has been found that some learning strategies tend to be more effective in one learning environment compared to the other. For example, collaborative tasks in face-to-face learning environments provide emotional support through opportunities “to create a sense of community and connectedness more quickly,”

which is lacking in the online environment (Garrison & Vaughan, 2008, p. 28). On the other hand, reflection and discourse through self-regulation of learning is not as strongly supported by face-to-face learning interactions. It is the asynchronous nature of online learning activities that encourages collaborative discourse, reflection, and self-regulation of learning outside of class (Vaughan, Cleveland-Innis, & Garrison, 2013). Blended learning environments are therefore beneficial for mitigating emotional distance (Vaughan et al., 2013) and developing metacognition and higher order learning skills (e.g., S. K. Taradi, M. Taradi, Radic, & Pokrajac, 2005; Tsai, 2014).

Various frameworks have been proposed for designing blended learning. For example, Wu, Tennyson, and Hsia (2010) found that a combination of the following factors: cognitive (e.g., computer self-efficacy), technological (e.g., flexible access to online activities) and social interactions, contributed to learner satisfaction. Another framework that has been most prevalent for informing blended learning design is Garrison and Vaughan's (2008) community of inquiry (Halverson et al., 2014) where social and cognitive presence is addressed in the face-to-face and online environment. According to this framework, social presence is best promoted through learning activities (e.g., wikis, blogs) that engage students in small group discussions, collaborative research, and cooperative group work (Vaughan, Cleveland-Innis, & Garrison, 2013). Cognitive presence in the online environment is developed through inquiry with the community of learners, using ongoing reflection and critical discourse. Many online learning activities, such as WebQuests, videos, simulations, and games provide learners with opportunities to gain knowledge and participate in a community of online inquiry (Figg & Jaipal-Jamani, 2015).

Digital Games

Generally, digital games are identified by a set of common characteristics that include explicit rule systems and players, visual and auditory com-

ponents, action and conflict, players competing against each other, or the game system, and the attainment of an outcome or a clear and quantifiable goal (Gee, 2013; Salen & Zimmerman, 2004). Additionally, it is the interactions among the technology, player thinking, and social interaction that create the gaming experience for players (Shaffer, Squire, Halverson, & Gee, 2005). Three corresponding constructs, rules, play, and culture, as described by Salen and Zimmerman (2004), provide educators with a simple framework to understand how games are designed to promote the gaming experience. Rules refer to the features used to organise the game such as the structure, elements, and mechanics. These design features determine player input and output, what choices players make, and what the outcomes or rewards of the game are. Play describes players' immersion experiences with the game and includes motivation to play and the tactics and strategies used while playing. Culture encompasses the larger context of the game which could be fictional or nonfictional and includes values, narrative, and community building. It is the use of a combination of these game features (rules, play, and culture) that capture the player's attention and enable the player to experience emotional well-being (e.g., happiness, pleasure) and satisfaction of psychological needs such as autonomy, competence, and relatedness (Ryan, Rigby, & Przybylski, 2006; Weber & Shaw, 2009).

Digital Games in Educational Settings

The use of digital games in educational settings has gained momentum because of the many benefits for the workplace and learning attributed to playing games. For example, many of the workplace skills employees are expected to have are similar to the skills that lead to success in gaming, such as strategic thinking, problem solving, and adapting to change (Federation of American Scientists, 2006). Many characteristics of the gaming environment are also purported to support development

of 21st century learning skills or competencies (Granic, Lobel, & Engels, 2014), such as critical thinking and problem solving, collaboration and teamwork, and computer literacy (Trilling & Fadel, 2009). The motivational benefits of digital games, through entertaining and capturing the attention of the player for long periods of time, are well documented (Deterding, Dixon, Khaled, & Nacke, 2011; Gee, 2003). Additionally, digital games have contributed to cognitive, skill, and attitude development (e.g., Egenfeldt-Nielsen, 2007; Vogel et al., 2006). Research also points to the applicability of games in educational settings because the game experience is consistent with experiential views of how students learn (Gee, 2013). As Gee (2013, p. 18) succinctly points out, “games are just well designed experiences in problem solving” where factual knowledge is used as a tool to solve a problem. When digital games are used for educational purposes, characterised by some type of learning that occurs by interaction of the player with the mechanics of the game, this learning experience is called digital game-based learning, or DGBL (Van Eck, 2015). The most prevalent forms of DGBL in education are the use of commercial off-the-shelf games (COTS) which are easily accessible or serious games, ones designed to train or teach specific skills and content. The application of DGBL in higher education settings is not widespread (Boyle et al., 2016) and this situation may be attributed to pedagogical and implementation issues and challenges experienced by instructors.

Issues and Challenges Using DGBL

A pedagogical issue that crops up when using COTS and serious games in educational settings is that commercial games may not meet a wide range of course learning outcomes. For example, the scope of the content covered by a video game may not adequately reflect the content as described in the course curriculum or provide sufficient

scaffolding for learning complex content (Faria & Wellington, 2004; Lean, Moizer, Towler, & Abbey, 2006). This limitation has led to instructors making teaching modifications to teaching strategies and assessment tools. Therefore, serious video games or COTS are often not used as primary instructional activities and are perceived as “most useful as a supplemental resource or a consolidation tool for student learning of [the content]” (Jaipal & Figg, 2009, p. 5). Another pedagogical issue is the type of learning promoted by DGBLs. Instructors wanting to promote reflection and higher order thinking processes in their subject areas are challenged to find suitable games promoting such learning goals. Many serious games primarily support the learning and reinforcement of factual information or acquisition of knowledge (Kiili, 2005) and professional training (e.g., medicine and business; Boyle, et al., 2016) through drill and practice, quizzes and tests, and training simulations.

Factors that contribute to implementation challenges have also been identified in the literature. Technical competence, especially lack of expertise or prior experiences playing games, influences instructor confidence in their ability to incorporate digital games in instruction (Faria & Wellington, 2004, Ritzhaupt et al., 2010; Van Eck, 2015). Instructor perceptions of games as an effective learning strategy, also affect their adoption of games. Research shows that perceptions of games are “based upon [instructor] professional judgement of benefit and risk, rather than on the resources available” (Lean et al., 2006, p. 239). In light of these barriers to faculty adoption of DGBLs, gamification offers instructors a way to take advantage of the motivational and cognitive affordances of games, in spite of modest technical competence levels. Gamification also enables the tailoring of the learning activity to match specific student needs and learning goals with fewer changes to existing instructional practices (Figg & Jaipal-Jamani, 2015).

GAMIFICATION IN HIGHER EDUCATIONAL SETTINGS

Gamification

Gamification is a recent trend in many public sectors, including education, because it incorporates aspects of games that can motivate, increase participation and engagement, and has the potential to improve learning (Dicheva, Dichev, Agre, & Angelova, 2015; Seaborn & Fels, 2015). Admittedly, there is controversy around the use of the term gamification. Critics argue that gamification as described in the literature, with its emphasis on the use of points, badges and leaderboards for task completion and achievement, is really pointsification (Robertson, 2010, para 11). While gamification does include the strategy of pointsification, there is consensus in the education literature that gamification involves the application of a range of game design elements in non-game contexts (Deterding et al., 2011). Seaborn and Fels (2015) further characterise gamification as: 1) being designed for non-entertainment purposes and 2) using elements of games, without creating a “fully-fledged game. In this way, gamified systems are game-like, but not a game” (p. 27). Studies on gamification in educational contexts do incorporate game elements beyond the points system (Dicheva et al., 2015). Besides the motivational game elements identified such as choice and rewards, Kapp (2012) and Stott and Neustaedter (2013) identify other dynamic gaming elements such as “providing learners with permission to fail, encouragement of out-of-box thinking, and fostering a sense of control” (Kapp, 2012, p. xxii) that contribute to rich learning experiences. It should be noted, however, that simplifying the complexity of the game application to a few game mechanics could result in less engagement of students and lead to an alienation of interest (Lee & Hammer, 2011; Stott & Neustaedter, 2013). As well, the use of game elements “is not practical for all learners, all content, all the time—any more than are lectures or textbooks” (Van Eck,

2015, p. 24) and will not meet all learning goals. Therefore, as Lee and Hammer (2011) point out, “we must carefully design gamification projects that address real challenges” (p.4).

Design Framework for Gamification

Kapp (2012) suggests that gamified learning environments are effective when they include these three components: 1) game-based mechanics, 2) aesthetics, and 3) game thinking.

- Game-Based Mechanics:** The game-based mechanics most used in educational settings are the use of badges, point systems, leaderboards, goals, and time limits (Dicheva et al., 2011; Kapp, 2012; Deterding et al., 2011). Applying these game mechanics to non-gaming situations provide the engagement and motivational aspects found in games such as freedom to fail, rapid feedback, progression, and story-telling (Stott & Neustaedter, 2013). For example, incorporating tasks, quests, or challenges that can be repeated with no penalty for failure supports freedom to fail and mastery of content. Experience points provide immediate feedback to players and rewards with badges and levels provide recognition of achievements and a record of progress. Competition through leaderboards acknowledges and recognizes achievements while providing a comparison of performance with others.
- Game Aesthetics:** Game aesthetics refers “to the way the game mechanics and dynamics interact with the game designer’s artistry, to produce cultural and emotional outcomes” (Dicheva et al., 2011, p. 3). It includes the visual and aural presentation of the gamified activity such as the presentation of tasks through a cohesive interface theme, the design of an attractive layout, the use of appropriate graphics, and ease of navigation through the material. These

aesthetic features contribute to feelings of satisfaction and how willingly a player accepts the gamification (Kapp, 2012).

- **Game Thinking:** Game thinking is described as, “thinking about an everyday experience and converting it into an activity that has elements of competition, cooperation, exploration, and storytelling” (Kapp, 2012, p.11). It is a mind-set where the element of fun or challenge is used deliberately to create an experience that motivates learners to engage in desired behaviors or learning goals (Werbach & Hunter, 2012) which are clearly communicated Figg & Jaipal-Jamani, 2015; Robson, Plangger, Kietzmann, McCarthy, & Pitt, 2015). Tasks should provide valuable information or skills, tap into personal interests and passions, provide an element of free exploration and play, result in mastery of skills, and vary in complexity and depth (Deterding, 2011; Van Eck, 2015).

There is consensus in the field that gamification holds potential to motivate and engage learners (Domínguez et al., 2013; Van Eck, 2015; Robson et al., 2015). Adding gamification to blended higher education courses through scaffolded, online learning activities is, however, a new practice which may be complex, and require some effort to make it motivating for students (de-Marcos, Domínguez, Saenz-de-Navarrete, & Pagés, 2014). In the next section, we describe an example of a successful gamified, blended learning environment in higher education.

Blended Gamification in Action: The *TPACK Quest*

The strategy of gamification was used to redesign an instructional technology methods course in a Faculty of Education. The purpose for redesigning the course was to address the problem of lack of motivation among preservice teachers (student teachers) to engage with background information (e.g., textbook readings) assigned to enhance in-

class learning experiences and to deepen their knowledge about teaching with technology, or technological pedagogical and content knowledge (TPACK; Mishra & Koehler, 2006). Drawing on aspects of the design frameworks of Wu et al. (2010) and Vaughan et al. (2013) for elements of blended learning, and Kapp (2012) for gamification components, a gamified, online learning environment, called the *TPACK Quest*, was created using Wordpress, a free blogging tool. To ensure a quality blended learning environment where online learning activities enhanced in-class activities, gamified, online activities addressed cognitive, technological, and social interactions respectively (Wu et al., 2010; Vaughan et al., 2013). For example, cognitive skills were developed by having preservice teachers learn about the characteristics and actions for effective teaching with technology through readings and interactive media; technological knowledge was developed through digital application tasks where new technical tools were used in authentic learning experiences, and social interactions were promoted through collaborative online discussions.

The design of the *Quest* was also informed by the three design elements discussed in the previous section (Kapp, 2012). *Game mechanics* included a pointsification scheme of ten badges and a *TPACK Quest* manifesto which guided game play. Grade points were awarded for each task, and badges were earned for completing a mission or series of tasks. The *Quest* badge missions included topics such as gamification, TPACK, digital citizenship, problem-based learning, and Web 2.0 learning objects. Acquiring ten of these badges resulted in earning the *Cup of Wisdom*. Four additional badges were awarded for a digital portfolio, professional conduct, completion of in-class activities, and attendance and punctuality. Completion of the latter tasks resulted in the *Professional Order of the TPACK Teacher* award. The *Quest* also incorporated a limited narrative introduced by an avatar in a video to provide a purpose and overall context for the activities. *Game aesthetics*, such as the colorful interface of the *Quest*, the consistent navigational elements, and a variety of

interactive learning objects throughout the online environment, promoted ease of participation. *Game thinking* was employed in three ways to design the tasks. First, tasks incorporated a variety of activities, with varying levels of difficulty and complexity. Secondly, tasks incorporated an element of challenge, or problem solving, around pedagogical thinking. Lastly, the element of fun was incorporated by challenging ‘players’ to use Web 2.0 tools in ways teachers used the tools within classroom instruction. For example, to earn the *Digital Teacher* badge, ‘players’ examined videos about flipped and blended learning outside of class, then used Cube4Teachers (<http://www.cubeforteachers.com/>), an online repository of teacher-selected resources, to select an activity. The task was to write an introductory paragraph introducing the activity, and insert that text into the newspaper headline generator at Fodey.com. The resulting image (newspaper clipping with their inserted text) was submitted to earn their badge. In class, the resources gathered through the experience were evaluated and top resources identified for the collaborative resource board, resulted in points towards the *Collaborator* badge.

The Research Study

A design-based research study (Anderson & Shattuck, 2012) was conducted over two years to investigate how gamification influenced teacher candidates’ TPACK, or understanding of how to teach with technology (cognitive), collaborate and use technology (skill), and professionalism (attitude). Teacher candidates were enrolled in six different sections of the technology methods course in which the *Quest* was implemented. Data were collected from 133 teacher candidates and data sources were online surveys, written reflections, and artifacts in digital portfolios. Data sources also included email interviews with the five different instructors teaching the technology methods course, researcher field notes from weekly instructor meetings, and instructors’ records. Instructors met weekly to discuss any issues or concerns with the course. Any changes

to the *Quest*, or the process for playing the *Quest*, were implemented into all sections. All data were analysed and coded by two independent raters with 100 percent unity of agreement.

The findings from online surveys and written reflections revealed that the gamified learning environment motivated teacher candidates to complete tasks (Figg & Jaipal-Jamani, 2015) and is consistent with other findings on gamification (Lee & Hammer, 2011; Hamari, Koivisto, & Sarsa, 2014). All written artifacts by preservice teachers were subjected to content analysis for evidence of TPACK learning gains. Results showed that the gamified blended learning environment stimulated cognitive development (progress of learning) through the visual tracking of learning, promoted self-regulated learning (at their own pace), and facilitated risk taking with technology (Figg & Jaipal-Jamani, 2015). Results were corroborated by survey data. For example, in response to the statement, “I feel I gained more knowledge about TPACK from playing the TPACK Quest than I would have from reading a textbook on the topic,” more than two thirds of students agreed or strongly agreed with the statement.

In this case, a blended learning environment enabled the instructors to teach existing curriculum using face-to-face pedagogical practices while incorporating the benefits of an online gamified learning environment. However, there is no doubt that instructors need technical skills to be able to create the digital interfaces and learning objects that comprise the learning environment. Instructors also need to have pedagogical expertise to be able to design a series of game tasks that are varied in depth, complexity, and difficulty while scaffolding the learning process (Figg & Jaipal-Jamani, 2015; Deterding, 2011).

FUTURE RESEARCH DIRECTIONS

Studies of gamification have focused on investigating how gamification influences motivation, engagement, and enjoyment of students during learning (Hamari et al., 2014). The case reported

in this chapter is one of the few examples in higher education that provides empirical evidence of the effectiveness of gamification to achieve learning goals related to a course with a large sample of students. There is a need for additional empirical studies to examine gamification and learning outcomes in different higher education disciplinary contexts. As well, studies show that the appropriateness of the context being gamified and the characteristics of students play a role in how effective the gamification strategy is (Hamari et al., 2014). As such, a future area of research could be to examine how context and characteristics of students influence the blended gamified learning environment. Another area for future research is investigating how instructor knowledge base to design blended gamified learning environments develops. This is important because instructors need knowledge in two areas, creating blended learning environments and using game design elements within instruction.

CONCLUSION

The barriers encountered by instructors when trying to implement digital games such as video games and simulations, often hinder the widespread use of games as an instructional strategy. This chapter presented current perspectives on how the affordances of games, such as choice, feedback, autonomy, and freedom to fail, can be incorporated into a gamified blended learning environment in higher education. Gamification is another digital game-based strategy that utilizes game mechanics, game aesthetics, and game thinking to achieve the motivational and engagement benefits of digital games within the constraints of curricular content that has to be taught. Furthermore, incorporating gamification into blended learning environments provides instructors with opportunities to use traditional face-to-face instruction thereby scaffolding faculty adoption of unfamiliar instructional strategies. A gamification strategy provides many of the benefits derived from games, without requiring instructors

to have the knowledge and experience to create or play games. Hence, gamification in blended learning environments is a promising instructional strategy that draws motivational and engagement aspects from game-based learning, and provides learners with opportunities for cognitive, skill, and attitude development.

KEY TERMS AND DEFINITIONS

Blended Learning: An instructional practice that involves using both online and traditional face-to face learning experiences where a part of the face-to-face instruction is replaced by online activities completed outside the classroom.

Digital Games: An interactive system on a digital device that is rule-based, played by one or more players, with variable or quantifiable outcomes that are ranked.

Digital Game-Based Learning (DGBL): Digital games created for learning purposes characterized by learning that occurs by interaction of the player with the mechanics of the game.

Gamification: One form of DGBL that uses game-based elements such as mechanics, aesthetics, and game thinking in non-game contexts aimed at engaging people, motivating action, enhancing learning, and solving problems (Borgos et al, 2014).

Chemistry Learning Through Designing Digital Games

Institute of Teacher Education – Sultan Abdul Halim, Malaysia

INTRODUCTION

As the labour market of the 21st century become increasingly emphasize on skilled human capital which are highly knowledgeable and innovative, STEM (Science, Technology, Engineering and Mathematics) education has slowly been making its way into classrooms. Efforts have been undertaken to improve the quality of STEM education in order to produce STEM literate students, i.e. students who are capable of identifying, applying, and integrating the STEM concept to understand complex problems and generate innovation to solve the problems (Chew, Noraini, Leong & Mohd Fadzil, 2013).

STEM literate students must have mastered the knowledge of science, particularly chemistry because chemistry is essential as the basic of most of the fields of science, technology and engineering (Balaban & Klein, 2006). Indeed, chemistry is often called the central science (Brown, LeMay, Bursten, Murphy & Woodward, 2011; Chang, 2007). Chemistry is also the foundation for innovation, scientific literacy and most notably problem solving in connection with sustainable development (Risch, 2010). Using chemistry knowledge, for instance, one can make judicious decisions to design new materials that are environmentally safe to solve various problems in everyday life. In the 21st century, chemistry will continue to play a leading role in providing solutions to ensure sustainable development.

Apart from knowledge, innovation and problem solving in the 21st century requires a new range of skills known as 21st century skills. For example, innovation and problem solving in today's world is driven by the formation of networks with multiple parties including experts and researchers with related interests as well as consumers and customers. The 21st century skills enable one to communicate and collaborate effectively with various parties.

Clearly, students in the 21st century need to become proficient in both chemistry knowledge and the 21st century skills. Therefore, the authors have initiated an innovation instructional strategy to support the acquisition of chemical concepts and the 21st century skills. A module known as MyKimDG has been developed as a mechanism for accomplishing the desired goals. The purpose of this article is to present conceptual framework of MyKimDG and demonstrate a brief lesson in MyKimDG to the teaching and learning of a specific chemistry unit.

BACKGROUND

Chemistry is usually perceived as a difficult and unpopular subject due to the abstract nature of chemical concepts. Previous studies on students' conception have revealed that students have many alternatives conception in chemistry. While the literature is replete with studies and papers, which

investigate students' understanding of chemical concepts and suggest potential remedies, fewer studies focus simultaneously on improving conceptual understanding and developing the 21st century skills. Hence, educators should be encouraged to design innovative and effective learning strategies to enhance both students' conceptual understanding and their 21st century skills. In this case, a change in chemistry teaching and learning approaches is critical. This is especially more crucial when educating today's students who are 'digital natives' (Prensky, 2001). The teaching and learning approaches must befit the needs of these digital natives and subsequently achieve the desired aspiration.

One approach suggested by researchers to educate the digital native generation is the integration of digital games in the teaching and learning processes as digital game is a medium favoured by students. Nowadays, the integration of digital games in learning or digital game-based learning (DGBL) is gaining popularity parallel with their popular reputation among students (Kamisah & Nurul Aini, 2013). Many studies have reported that DGBL can provide positive impact on students' learning. In general, the studies on DGBL were carried out through two approaches, namely (1) student as game consumer or player, and (2) student as game designer.

In the first approach, the students were involved in playing commercial digital games in the market or educational digital games developed by educators. However, there are many obstacles to implementing the student as game consumer approach. For instance, the contents of commercial digital games are inaccurate or incomplete (Van Eck 2006) and the development of professional educational digital games is time-consuming (Hwang et al. 2013). In addition, many gamers do not play educational digital games as they find these games not compelling (Pivec 2009). This happens because educational digital games are designed by academics who do not really understand the art, science and culture of digital game design (Van Eck 2006). As a result, the product has failed

dismally as a game. Prensky (2008) also raised this issue and states '...the students had no input into its creation, and the stuff came out cute to the adults, but boring to the kids'. According to Prensky (2008), students even told straight forwardly: 'Don't try to use our technology, you'll only look stupid.'

One alternative of DGBL approach that has been proposed by some scholars (such as Kafai, 1996; Papert, 1998; Jung & Park, 2009; Kamisah & Nurul Aini, 2013) is for students to design their own digital games. Many studies have reported that this approach provide opportunities for students to explore ideas according to their own interests (Kafai & Ching, 1996); acquire knowledge of programming (Kafai, Ching & Marshall, 1997); as well as become active participants and problem solvers, engage in social interaction by sharing their designs and helping each other, and take ownership of their own learning (Baytak & Land 2010).

In addition, Vos, van der Meijden and Denessen (2011) has reported that the student as game designer approach is a better way to increase student motivation and deep learning compared to the student as game consumer approach. Lim (2008) and Prensky (2008) also recognized the potential of this approach in improving student motivation and engagement. According to Lim (2008), when students are given the autonomy to take responsibility for their own learning and co-design learning experiences with teachers and other students, they are more inclined to engage in their own learning process. Hence, one way to do so is by allowing students to become designers of their own digital games based on their own interpretation of the school curriculum. For Prensky (2008), students will be motivated if they are allowed to do something extraordinary in learning at school and gain recognition for producing digital games. Therefore, the authors have initiated an innovation to take advantage of the student as game designer approach to support the acquisition of chemical concepts and the 21st century skills.

CONCEPTUAL FRAMEWORK OF MYKIMDG

Principles derived from learning theories play an important role in guiding MyKimDG development. Two important theories in learning and education that incorporate into MyKimDG development are constructivism and constructionism.

According to constructivist theory of learning, learner is knowledge builder. Learner does not receive knowledge passively, but he/she interprets the knowledge received and then modifies the knowledge in a form that is acceptable to him/her. In other words, individual learner actively constructs new knowledge pursuant to his/her existing knowledge. In addition, the process of knowledge construction can be improved through social interaction and discovery. Vygotsky (1978) believed that interaction between learner and teacher or more skillful peers will provide scaffolding to learner within the Zone of Proximal Development to construct new knowledge. However, no interaction would be beneficial if the new information is presented to students traditionally. Instead, students should be given the opportunity to explore or discover the new knowledge. Bruner (1966) believed that learning and problem solving emerged out of exploration of new knowledge.

In addition to the constructivist theory, constructionist theory of learning asserts that the construction of new knowledge happens felicitously in a context where students are consciously involved in the production of external and sharable artefacts (Papert 1991). This theory goes beyond the idea of learning-by-doing as indicated by Papert (1999a) that 'I have adapted the word constructionism to refer to everything that has to do with making things and especially to do with learning by making, an idea that includes but goes far beyond the idea of learning by doing.' Indeed, Papertian constructionism challenges the learner applying the knowledge being explored to construct more complex ideas or larger theory. This theory emphasizes the role of design (making,

building or programming) (Kafai & Resnick, 1996) and external objects (Egenfeldt-Nielsen, 2006) in facilitating the knowledge construction. The constructionist theory of learning also values the diversity of learners and social aspects of learning (Kafai & Resnick, 1996). In the constructionist learning environment, the designers or learners create artefacts which are significant to themselves based on their interests, learning styles and their experience, and share their artefacts as well as the artefacts' designing process with peers. In this process, peers act as collaborators, coaches, audiences and co-constructors of knowledge.

Computers play a role in the constructionist learning theory. Computers can be used as a building material (Papert, 1999a). According to Papert and Franz (1988), a computer is a 'material to be messed about with'. Learning occurs when learners are 'messaging about' with the computer. The introduction of computers is also able to change the context of learning (Papert, 1991). Computers can serve as a convivial tool (Falbel, 1991). The willingness of learners to learn will increase because they can use the computer in building artefacts (Papert, 1991).

Both constructivist and constructionist theories imply that learning depends on the learners themselves and learning can be enhanced through social discourse and discovery. Figure 1 illustrates the interconnections among the learning theories. Additionally, constructionist theory suggests that learning can be further enhanced if learners are involved in collaborative artefact designing projects using ICT as construction material.

Learning Approach

Based on constructivist and constructionist theories, learning approaches such as collaborative learning, discovery learning and learning through designing digital game (student as game designer) are integrated in MyKimDG. Figure 2 summarizes the focus of each learning approach in manoeuvring learning activities in MyKimDG.

Figure 1. Interconnections among the constructivist and constructionist learning theories

- Collaborative Learning:** Activities in MyKimDG are designed so that students engage in discussion, share and exchange ideas in groups. Through this approach, triggering of cognitive conflict and restructuring of ideas will occur when students share their ideas from their own perspective. It also improves students' 21st century skills such as collaboration, communication and interpersonal skill because students are able to practice in the real world.
- Discovery Learning:** Students are guided towards exploring chemical concepts. Students will gain deeper understanding when they are given opportunities to discover or construct new concepts or understanding for themselves. It also lets students experiencing the discovery activities, and stimulating their own thinking. As students embark on the discovery process, teacher reminds them of the important of the process in learning. If they can perceive the values of the process, they will be motivated to learn chemistry. In this approach, students are empowered to take responsibility for their own learning and practice the 21st century skills in real situations.
- Learning Through Designing Digital Game:** In MyKimDG, students are involved in designing PowerPoint games related to chemical concepts. They discuss in groups and apply the concepts learned to design PowerPoint games. With this, students can visualize the concepts in the sub-microscopic level. This approach can also create or learning environment that allows students to make decisions about the design of the desired PowerPoint game, apply ICT and collaborate in a social context.

Figure 2. Focus of learning approaches in MyKimDG

PowerPoint game is selected as Microsoft PowerPoint software is available at all schools and the use of the software does not involve additional cost and complicated programming languages. The only technical skill that students need to master to design PowerPoint games is how to create custom animations. In addition, existing PowerPoint game templates are available online and can be modified by students to help them progressively master the game designing skills. This strategy is parallel with the development phases proposed by Rieber, Barbour, Thomas and Rauscher (2008). However, students are also encouraged to use other software like *Game Maker* and programming languages such as *Java*, *Logo* and *Scratch* if they are skilled in the software.

When students carry out their digital game designing project, they are guided to move through the creative design spiral (Rusk *et al.*, 2009) in order to assist them develop new ideas. Students are also given the autonomy to choose their own game design, plan and carry out the project based on the group's consensus. The students are also told that the PowerPoint game will be used to help their peers who face difficulty in learning the chapter. It is expected that this strategy will improve students' perceived competency, autonomy and relatedness, and hence increase their motivation in chemistry.

The learning through designing approach aims to deepen students' conceptual understanding in chemistry as cognitive conflict may be triggered during activities and hence, new understanding may discover. As the same time, it provides a platform for students to develop their 21st century skills.

Instructional Model and Strategy

Over the past decade or so, there has been a significant effort to improve conceptual understanding. Studies have revealed that mastery of science concepts will be enhanced if students become aware of their misconception. To help students realize their misconception and replaced it with

scientifically acceptable concept (i.e. conceptual change), cognitive conflict strategy has been proposed by scholars such as Piaget (1977) and Posner, Strike, Hewson and Gertzog (1982). Therefore, the BSCS 5E Instructional Model (Bybee *et al.*, 2006) designed to facilitate conceptual change is applied in MyKimDG.

To help students understand the chemical concepts, students are guided to explain macroscopic experience at the sub-microscopic and symbolic levels. It is known that conceptual understanding in chemistry involves making use of three main representations or levels. The triplet relationship is the key model in chemical education (Gilbert & Treagust 2009).

In MyKimDG, the phases of the BSCS 5E Instructional Model and Creative Design Spiral have been modified and standardized. The resultant phases are Inquiry, Discover, Produce, Communicate and Review (IDPCR). Table 1 shows the IDPCR phases in MyKimDG and related phases of the BSCS 5E Instructional Model and Creative Design Spiral.

During implementation of MyKimDG, students are guided to experience and realise the IDPCR phases. As the process is done repeatedly, new ideas are always generated and students' 21st century skills such as inventive thinking skills are developed. Students are expected to practice the process in everyday life and in the workplace. Apart from that, it is expected that the acronym IDPCR can help students remember the five im-

Table 1. Phases in MyKimDG and related phases of the BSCS 5E Instructional Model and Creative Design Spiral

MyKimDG	BSCS 5E Instructional Model	Creative Design Spiral
Inquiry	Engage	Imagine
Discover	Explore	Experiment
Produce	Elaborate	Create
Communicate	Explain	Share
Review	Evaluate	Reflect

portant clusters of 21st century skills, i.e. Inventive thinking, Digital-age literacy, high Productivity, effective Communication and spiritual values (*nilai Rohani*). The five clusters of 21st century skills have been identified by Kamisah and Neelavany (2010).

Table 2 shows the outline of instructional activities in MyKimDG.

IMPLEMENTATION OF MYKIMDG

In the following section, the authors present a brief lesson in MyKimDG to the teaching and learning of a specific unit which involved precipitation reaction (see Figure 3). The lesson is designed to

created learning environment that allows students to work together to learn and discover ideas or concepts. Activities are designed to engage students in self-assessing their ideas, communicating their ideas and making decisions based on the group's consensus. To assist students understand why precipitation reaction is used in the preparation of insoluble salt, they are engaged in discovery activity (see the Inquiry phase). Afterwards, they are given opportunity to plan and conduct investigation based on the conclusion made (see the Discover phase).

To extend students' understanding about the observed phenomenon (i.e. precipitation reaction), they are given tasks to design digital games using ICT to teach their peers who face problems

Table 2. Outline of instructional activities in MyKimDG

Phase	Purpose	Activity
Inquiry <i>Predict, ask, hypothesize, identify problem, brainstorm</i>	1. Arouse students' interest 2. Access students' prior knowledge 3. Elicit students' misconceptions 4. Clarify and exchange current conceptions	1. Teacher shows discrepant events. 2. Students make observations and explain the phenomena at the sub-microscopic and symbolic levels. 3. Students discuss in groups and compare their ideas with their peers.
Discover <i>Investigate, experiment, explore</i>	1. Expose to conflicting situations 2. Modify current conceptions and develop new conceptions 3. Provide opportunities for students to demonstrate their conceptual understanding, and skills	1. Students perform hands-on and minds-on activities in groups. 2. Students are encouraged to engage in discussions and information seeking using ICT. 3. Students generate explanation of the observed phenomenon. 4. Students practise the skills needed in an experiment or activity. 5. Students are asked to communicate in groups and report back with their findings.
Produce <i>Create, construct, invent, build, design, tinker, elaborate</i>	1. Challenge and deepen students' conceptual understanding and skills 2. Provide additional time and experiences that contribute to the generation of new understanding	1. Students apply their new ideas by conducting additional activities 2. Students perform additional tasks that are more complex and involve higher order thinking skills (HOTS). 3. Students carry out open-ended projects. 4. Students create digital games.
Communicate <i>Explain, share, discuss with peers, ask an expert, defend</i>	1. Provide opportunities for students to share their new understanding and skills 2. Provide opportunities for students to exchange their new understanding	1. Students report back with their new ideas and skills. 2. Students also listen to input from peers and defend their ideas. Peer's input may guide them towards deeper level of understanding. 3. Students compare their ideas with the teacher's explanations.
Review <i>Check, evaluate, reflect, improve, repair</i>	1. Students assess their understanding, skills and competencies 2. Students think creatively for the purpose of improvement 3. Teachers evaluate student progress toward achieving the learning outcomes	1. Students reflect upon the extent to which their understanding, abilities and competencies have changed. 2. Students improve their ideas or skills based on reflection or input from peers. 3. Teacher conducts a test to determine the level of understanding of each student.

in the learning of the chemical concept (see the Produce phase). At this phase, students are engaged in designing *PowerPoint* games to represent the dissolution and precipitation reactions at the sub-microscopic level. First, each student develop an 'expressed model' to represent his/her own visual perception (or mental model) about the reactions. An individual's mental model is inaccessible to

others but the expressed models can be used for discussion (Gilbert, 2005). Eventually, a final model is developed based on group's consensus. Figure 4 shows example of dissolution model created by students. Through this activity, students gain knowledge about what occur between particles during reactions, hence increase students' conceptual understanding. Additionally, students

Figure 3. A brief lesson in MyKimDG

Phase 1: Inquiry

1. Teacher demonstrates two reactions that may be used to prepare lead(II) sulphate:

	Reaction	Observation	Chemical equation
A	Lead(II) nitrate solution + sodium sulphate solution		
B	Excess solid lead(II) carbonate + dilute sulphuric acid		

2. Students record the observations and write the chemical equations involved.
3. Students describe how to obtain lead(II) sulphate from the mixture in Reaction A and B.
 - (a) Draw the set-up of the apparatus is involved.
 - (b) In your opinion, which reaction is more appropriate to prepare insoluble salts such as lead(II) sulphate? Explain your answer.
4. Students make a conclusion about the appropriate reaction to prepare insoluble salts.
5. Students share their findings with other groups.
6. Students are asked to explain the strategy used, i.e. inquiry-discovery.

Phase 2: Discover

1. Students plan experiments to prepare lead(II) iodide and silver chloride in group.
 - (a) Discuss the materials needed to prepare lead (II) iodide and silver chloride.
 - (b) Write the chemical equations involved.
 - (c) Plan the procedures for experiment by constructing flowchart.
2. Students carry out experiment to prepare lead(II) iodide and silver chloride.
3. Students generate explanation of each phenomenon.
4. Students are asked to report back with their findings.

Phase 3: Produce

1. Students play a game related to the precipitation reactions involved in the preparation of insoluble salts.
2. Students are asked to differentiate between a good game and a bad game.
3. Students are asked to improve the game to make it more educational and entertaining following phases of IDPCR, in order to help their peers who face difficulty in learning the concept.
 - 3.1 Inquiry: Students convey his/her idea about the chemical concept and design of game through model (i.e., diagram, drawing, physical replica, etc.). Students select a promising model from their brainstorming session.
 - 3.2 Discover: Students create their designs using *PowerPoint*. Students are encouraged to test frequently and think critically about their designs, and rebuild as needed.
 - 3.3 Produce: Students produce their *PowerPoint* games based on improvements suggested through testing.
 - 3.4 Communicate: Students share their designs and *PowerPoint* games and get input from other groups.
 - 3.5 Review: Students describe the key strengths and weaknesses of their designs and *PowerPoint* games. Students create their own *PowerPoint* game in groups that incorporates the best aspects of all the designs.
4. Students are told that they may commercial their innovative product to benefit financially.
5. Students are reminded to apply 21st century skills during the project.

Phase 4: Communicate

1. Students share their digital games with other science or chemistry educators.
2. Students improve their digital games.

Phase 5: Review

1. Students plan and carry out experiments to prepare lead(II) chromate and barium sulphate in group.
2. Students write the chemical and ionic equation involved.
3. Students reflect upon the extent to which their understanding, abilities and competencies have changed.

need to carefully plan, utilize time and 21st century tools and resources toward the goal. At the end of project, they are also asked to improve and produce higher quality *PowerPoint* games that incorporates the best aspects of other groups' designs. The strategy is able to increase students' 21st century skills because students are able to immerse themselves in the real-world practice.

Students are also engaged in design or product justification (see the Produce and Communication phases). Students listened to input from peers and teacher, and defended their ideas. Input from peer and teacher may triggered cognitive conflict and result in reconstruction of existing ideas. Such support or scaffolding deepen students' understanding. At the end of lesson, students are assessed to determine their level of understanding. Students also reflect on how the IDPCR phases have contributed to their own development.

CONCLUSION

Students can be assisted to improve their conceptual understanding in chemistry and develop their 21st century skills. In this study, the authors have tried to provide an innovative chemistry

instructional strategy by integrating collaborative learning, discovery learning and learning through designing digital games. The learning strategy will create supportive learning environment for student to learn chemistry meaningfully. Most importantly, MyKimDG allows students to practice the 21st century skills in real situations. In conclusion, the implementation of MyKimDG can lift students' achievement in chemistry and their 21st century skills.

FUTURE RESEARCH DIRECTIONS

Quality assessment is essential in measuring the effectiveness of MyKimDG. Assessments enable teachers to evaluate learning while it is occurring. However, assessing of 21st century skills learning can be quite challenging. For instance, when faced with a collaborative task, teacher need to decide how to assign credit to each member of the group, as well as how to account for differences across groups that may bias a given student's performance (Binkley et al., 2012). Hence, further study need to be carried out to develop ways or specific rubrics to assess the 21st century skills. Assessment rubrics offer clear guidelines or expectations to

Figure 4. Example of dissolution model created by students

students on how the expectations are being met as well as the acceptable level of achievement. The assessment results inform teachers and students about their progress. It can also be leveraged to inform the revision of the MyKimDG module being developed.

KEY TERMS AND DEFINITIONS

21st Century Skills: A set of skills that students need to develop in order to succeed in the 21st century.

Constructivism: A learning theory that suggests that individual learner actively constructs new knowledge pursuant to his/her existing knowledge.

Constructionism: A learning theory that suggests that construction of new knowledge happen best through designing external and sharable artefacts.

Digital Game: Any game played using electronic device, either online or stand-alone.

Digital Game-Based Learning: An instructional approach that integrates digital games in learning.

Learning Through Designing: An instructional approach that integrates design activities in learning.

MyKimDG: A module that incorporates collaborative learning, discovery learning and learning through designing digital game in chemistry learning.

Clinical Use of Video Games

Ben Tran

Alliant International University, USA

INTRODUCTION

Video game play is the fastest growing form of entertainment in the world and many adolescents play video games for hours every day. For example, a nationally representative study of video game play among adolescents in the United States showed that 97% of adolescents aged 12 to 17 years play computer, web, and portable or console video games (Lenhart, Kahne, Middaugh, Macgill, Evans, & Vitak, 2008). In terms of frequency, 31% of adolescents play video games every day and another 21% play video games 3 to 5 days a week. Similarly, Gentile (2009) conducted a large survey study in the United States and found that 88% of youth aged 8 to 18 years play video games and the average amount of time spent playing video games per week is 13.2 hours. Furthermore, in the United States, 91% of children between the ages of 2 and 17 play video games (Granic, Lobel, & Engels, 2014), and a nationally representative study of U.S. teenagers found that up to 99% of boys and 94% of girls play video games (Lenhart et al., 2008).

A video game, according to Wikipedia (2016), is an electronic game that involves human interaction with a user interface to generate visual feedback on a video device such as a television screen or computer monitor. The word video in video game traditionally referred to a raster display device, but in the 2000s, it implies any type of display device that can produce two- or three-dimensional images. The electronic systems used to play video games are known as platforms and these platforms range from large mainframe computers to small handheld computing devices (Wikipedia, 2016). Hence, in the United States alone, video games brought in over \$25 billion in

2010, more than doubling Hollywood's 2012 box office sales of \$10.8 billion in the United States and Canada (Motion Picture Association of American, 2012). Despite the extreme popularity of video games among adolescents, however, researchers in the fields of developmental and social psychology examining video game have focused mainly on the association between video game use and negative outcomes, while research on positive outcomes is more limited. Video games, and the usage of video games, in adolescent therapy and psychotherapy is anything but ubiquitous. Hence, the purpose of this chapter is on video games and their usages in adolescent therapy and psychotherapy. This chapter will cover a brief and condensed history in the usage of video games in relations to clinical usage (and not on the historical development of video games and the video game industry per se), video games in psychotherapy, and the different types of video games and their usages in psychotherapy.

BACKGROUND

According to Ceranoglu (2010), the first video game materialized on an oscilloscope screen in 1958 (Kent, 2001) featuring a game of simulated tennis that amused visitors to Brookhaven National Laboratory. Thereafter, video games have become a major part of pop culture and the entertainment medium of choice for millions of people (Gettler, 2008; Poole, 2000). However, for many, video games were first created in the 1970s and since then have grown into a multibillion-dollar industry: the annual U.S. retail sales of video games reached more than \$9.9 billion in 2004 alone (Greitemeyer & Osswald, 2010; Sestir &

DOI: 10.4018/978-1-5225-2255-3.ch284

Bartholow, 2010). According to Greitemeyer and Osswald (2010), large-scale surveys show that 70% of homes with children ages 2 to 17 years have computers and 68% have video game equipment (Woodard & Gridina, 2000). Eighty-seven percent of children play video games regularly (Walsh, Gentile, Gieske, Walsh, & Chasco, 2003). Children ages 2 to 7 years spent an average of 3 to 5 hours a week playing video games (Gentile & Walsh, 2002), while 8th and 9th-grade students average 9 hours per week (Gentile, Lynch, Linder, & Walsh, 2004).

Video Games in Psychotherapy

A review of the available literature on video game use in psychotherapy takes a dynamic perspective in regards to psychotherapy, although it should be noted that the issues addressed here can be applied to many forms of psychotherapy. A literature search was conducted, according to Ceranoglu (2010), on Medline and PsycInfo with keywords *video games*, *psychotherapy*, *computer games*, and *child and adolescent*, and relevant manuscripts were also identified through citations in the articles identified during the primary search. In so doing, video game, is defined as a game that employs electronics to create an interactive system that includes a user interface to generate a visual feedback on a video device (Wolf, 2002), and found their way into the clinical care of youth in mental health care as well as other fields, and academic interest in clinical use of video games is increasing steadily.

Review of a database of academic manuscripts reveals that 1,121 of 1,474 total reports on video games (76%) were published in the past decade. Reported clinical uses of video games include psychoeducation in chronic disease management to increase treatment adherence (Yoon & Godwin, 2007) and physical therapy and rehabilitation following traumatic brain injury (Jannink, van der Wilden, Navis, Visser, Gussinklo, & Ijzerman, 2008). Video games also serve as valuable adjuncts in pain management during medical procedures

(Das, Grimmer, Sparnon, McRae, & Thomas, 2005; Gold, Kim, Kant, Joseph, & Rizzo, 2006), induction of anesthesia (Patel, Schieble, Davidson, Tran, Schoenberg, Delphin, & Bennett, 2006), or cancer chemotherapy (Kato, Cole, Bradlyn, & Pollock, 2008; Redd, Jacobsen, Die-Trill, Dermatis, McEvoy, & Holland, 1987).

Video Games and Their Usages in Psychotherapy

The usage of video games that have received some attention of video game researchers is that of therapeutic sessions (Annema, Verstraete, Abeele, Desmet, & Geerts, 2013). According to Annema et al. (2013), video games can help motivate patients, develop skills and serve as a distractor in pain management. Video games have been used in physiotherapy, occupational therapy, and psychotherapy (Burdea, 2003; Griffiths, 2003). As such, when considering the use of video games in therapy, a distinction can be made between games specifically made for therapeutic purposes and games made for the general public but that are used in therapy as well. An example of the last category, dating back almost two decades, is the use of the *Super Mario Brothers* and (*The Legend of*) *Zelda* games in addition to the regular psychotherapy program to assess and assist various abilities of children, such as problem solving strategies and means of dealing with success and failure (Gardner, 1991). Hence, literature survey revealed that different kinds of software are used in different types of clinical practice and research. These included serious games, commercial video games, computer programs developed for use in assessing cognitive abilities, and virtual reality used in psychiatric symptom research and training of health care professionals. Literature was also diverse in regard to delivery format of the games, such as computers, specifically designed hardware, handheld devices, and gaming consoles. With that said, Wilkinson, Ang, and Goh's (2008) article, is one of few articles that outline the video game revolution.

First Usage of Video Games

Specific video games are also designed for use in mental health care. The repeatability aspect of video games, as compared with other media forms, is useful in delivering manual-behavioral interventions such as those involved in cognitive-behavioral therapy (USAB, Holzinger, & Gesellschaft, 2007). Recently, the first video game developed to support cognitive-behavioral therapy by offering attractive electronic homework assignments and rehearsing basic psychoeducational parts of treatment has been reported in the literature (Brezinka, 2007, 2008). Video games were also found useful in group therapy for youth in distress, and have been noted to facilitate change in the moral developmental stage of adolescents involved in such therapy (Sherer, 1994). Another game is still in the testing phase for use in a solution-focused intervention for adolescents and is available to mental health professionals participating in studies of its efficacy. Therapists observe the game play to provide a structure to sessions, help build an effective patient-therapist relationship, and improve patient engagement in the therapeutic process (Coyle, Doherty, & Sharry, 2009). Games to enhance social skills training for children with developmental disorders also exist (Mineo, Ziegler, Gill, & Salkin, 2009). These programs feature virtual environments where the player controls as *avatar*, an actor within this environment, using a keyboard, mouse, or a gamepad. Through interactions with the virtual environment, the player may rehearse learned and problem-solving skills.

Some researchers from a psychology/psychotherapy background have developed their own games for use in therapy (Clark and Schoech, 1984; Oakley, 1994) while others have surveyed the use of computers in the area (Resnick & Sherer, 1994; Griffiths, 1997). Thereafter, in 1984, a psychotherapeutic text based game entitled *Adventures of Lost Loch* was developed for use in therapy by adolescents with low impulse control (Clark & Schoech, 1984). Hence, clients

were more cooperative with their therapists, with whom they developed effective therapeutic relationships and their session attendance rate greatly improved (Coyle, Matthews, Sharry, Nisbet, & Doherty, 2005).

Other games have incorporated subject matters particularly relevant to therapy. For example, SMACK (Oakley, 1994) deals with the decisions and consequences related to drugs. Furthermore, there has been increasing use of biofeedback-based video games for the treatment of anxiety disorders and attention problems. At NASA's Langley Research Center, Alan Pope has developed methods for using off-the-shelf Nintendo and Playstation games in combination with electroencephalogram (EEG) biofeedback, to train children with attention deficit disorder (ADD), attention deficit hyperactivity disorder (ADHD), and hyperactivity disorders. Results concluded that the inclusion of games in normal biofeedback treatments increased the therapeutic effect on ADD symptoms. Both children and parents rated as significantly higher enjoyment of coming to video game based sessions. Children found the sessions more inherently motivating and remained more focused on tasks (Pope & Paison, 2001).

Second Usage of Video Games

Although the 1980s saw a variety of controlled experiments on the effectiveness of video games in therapy, mental health research on video games in the 1990s came to be dominated by their adverse effects, and only in the 2000s does the argument for video game therapy reappear with frequency. In the 1980s Larose, Gagnon, Ferland, and Pepin (1989) reported significantly improved spatial abilities of adolescents with minimal brain damage or attention problems by means of a modified Atari game. During the following decade video games were increasingly studied as medical and psychosocial hazards (Griffiths, 1996) or addictive (Griffiths & Hunt, 1998). Recent reviews of the positive advances in video game therapy (Griffiths, 2004; Saloni-Pasternak & Gelfond,

2005) consistently respond to this preconception by opening on a defensive note. Despite this diversion of attention, video game therapy has been applied to a wide range of mental health concerns, all of which might now be extended by online treatment.

- **Aggression:** Given the trend to view video game violence as a factor in aggression, it is interesting to note that handful of researchers who have opted to explore an alternative viewpoint whereby video games might play an active role in curbing aggressive behavior. One team has pursued the long-term, development of a multimedia program called SMART Talk (Bosworth, Espelage, DuBay, & Daytner, Karageorge, 2000), which incorporates video games and simulations as part of a computer-based intervention that significantly diminishes middle-school students' beliefs that are supportive of violence and increases their intentions to use non-violent strategies.
- **Anxiety Disorders:** Inquiries into 2D video games for anxiety treatment can be found alongside a variety of graded exposure therapies using virtual reality. Sharry, McDermott, and Condrón (2003) propose *Relax to Win*, a biofeedback-based 2D game for the treatment of children with general anxiety problems. With *Relax to Win*, two on-screen dragons would race each other, and the more relaxed the players are, the faster the dragon would run, as measured by the players' galvanic skin response. Video games also prove realistic enough to generate successful graded exposure trails against phobias of spiders (Bouchard, Cote, Saint-Jacques, Robillard, & Renaud, 2006), heights or enclosed spaces (Emmelkamp, Krijn, Hulsbosch, De Vries, Schuemie, & Van Der Mast, 2002; Robillard, Bouchard, Fournier, & Renaud, 2003), and fear of driving after an accident

can be comparably reduced by virtual reality driving games, on their 2D equivalents (Walshe, Lewis, Kim, O'Sullivan, & Wiederhold, 2003).

- **Attention Deficit Hyperactivity Disorder:** Video game therapy for children with ADHD has elicited a relatively large amount of scholarly attention, because many children who do not inhibit their hyperactivity in other contexts will do so when playing intrinsically motivating video games. Lawrence, Houghton, Tannock, Douglas, Durkin, and Whiting (2002) highlighted that 6- to 12-year-old boys with ADHD perform beneath a normally developing control group when playing a cognitively demanding adventure video game, an even more so on a route task outside the laboratory, but perform equally well on a motor-skill targeting game that does not involve high working memory or distractor loads. This engagement makes video games ripe for therapeutic applications. Furthermore, there is some evidence that video games can contribute to reducing ADHD symptoms. The first therapeutic video game for children with ADHD was by Pope and Bogart (1996), whose Extended Attention Span Training (EAST) system modifies a NASA program that assesses the engagement of pilots using automated flight management systems. Pope and Palsson (2001) further develop this NASA patent as an ADHD intervention that decreases players' control over off-the-shelf PlayStation games when their EEG reports lower attention, measured as higher theta-to-beta wave ratio.
- **Autism:** Therapeutic computer games are of special interest for autism, since rules-based environments present a safe-appealing vehicle for interventions to improve socialization. More recently, it has been demonstrated that 13- to 18-year-olds with autistic spectrum disorder interact with

virtual environments on a par with control groups, suggesting a potential for virtual environments to serve as a medium for education about social conventions (Parsons, Mitchell, & Leonard, 2004, 2005). Furthermore, several researchers have worked on therapeutic video games for autistic children. Tanaka, Klaiman, Koenig, and Schultz (2005) are developing *Let's Face It!*, a suite of games designed to teach ability-appropriate distinctions between faces and objects, and recognition and labelling of facial expressions (Tanaka et al., 2005). Whalen, Liden, Ingersoll, Dallaire, and Liden (2006) developed a rigorously tested computer-assisted instructional program called *TeachTown*, which uses a suite of game-like tests and professionally designed visual reinforcements to make a demonstrated positive impact on receptive language, social understanding, self-help, attention memory, auditory processing and early academic skills for children with autism and other developmental delays.

- **Personality and Psychotic Disorders:** Scattered efforts have been made to bring video games to bear on the most challenging personality and psychotic disorders. On one end of the spectrum are Sieswerda, Arntz, and Wolfis (2005), who employ the simplest of worm and tennis games not for any therapeutic content, but to tease out responses involving potential differences in dichotomous evaluations among subjects with border-line personality disorder, cluster or antisocial personality disorders, and a control group with no diagnosed personality disorder. On the other end is Shrimpton and Hurwirth's (2005) account detailing the development of an elaborate adventure game to educate young people who have experienced their first psychotic episode. An interdisciplinary panel of experts is convened to study the prototype, and they demand substantial redevelopment-

mental in order to make the intervention an effective aid in young people's recovery from psychosis. Studies of video games applied to schizophrenia include Crookes and Moran (2003), who prepared a simple joystick-controlled game in order to assess how quickly subjects of different ages and genders can find cheese hidden on a 4x4 grid according to certain classical conditioning rules that healthy adults naturally filter out, but that schizophrenics do not, and Da Costa and De Catvalho (2004), who established that a group of medicated schizophrenics respond positively to completing cognitive tasks in virtual reality, suggesting a new medium for therapeutic interventions.

- **Children and the Elderly:** It is evident from the foregoing that children and adolescent have been the primary targets of therapeutic video games. While adults are comfortable with direct face-to-face dialogue, many children struggle to express themselves with words alone and use of therapeutic channels such as video games and other means provide children with an avenue for indirect communication (Coyle, Doherty, Matthews, & Sharry, 2007; Coyle, Matthews, Sharry, Nisbet, & Doherty, 2005). Several comprehensive overviews of the literature for this entire age range have appeared (Goh, Ang, & Tan, 2008; Griffiths, 2003; Saloni-Pasternak & Gelfond, 2005), and beyond these, several reports on subgroups can be found. Kokish (1994) presents the first recommendations on materials for computer play with preschoolers, and Aymard (2002) discusses a computer drawing game for projective use, to stimulate catharsis and affective expression in preschoolers and school-age children. Reaching at-risk youth by means of video games is also a recurring theme. For example, Resnick (1995) reports on *BUSTED*, a computer-

ized game to promote reflection on anti-social behavior in young offenders, and Sherer (1994) reports a controlled study of the effects of a moral development game on youth in distress. Dominic Interactive is an example of a DSM-IV-based diagnostic tool for children aged 6-12, in which a series of yes/no questions aim to give children greater scope for self-expression via a format akin to a video game. It has undergone validity testing in the U.S. (Valla, Bergeron, Saint-Georges, & Gaudet, 1997) and other countries (Villa, Kovess, Chan-Chee, Berthiaume, Vantalon, Piquet, Gras-Vincendon, Martin, & Alles-Jardel, 2002). The elderly, on the other hand, represent another demographic that has received its share of attention from therapeutic video game developers. Counting for Goblins is a computerized version of the counting Span task, which older subjects found more interesting than the offline equivalent, and which features automatic measurement of accuracy and response times (Barnes, Yaffe, Belfor, Jagust, DeCarli, Reed, & Kramer, 2006; Ryan, 1994).

FUTURE RESEARCH DIRECTIONS

When it comes to video games and their usage in psychotherapy in the future, only technology, and the imagination of software programmers and innovative therapists/psychologists can tell. Approximately a decade ago, Berker, Brinkman, and Deardorff (1995) tested a computer intervention for adolescent children of divorce that involved a trip to the lab to play a therapeutic video games, mail-out a post-test one week later, and a 10-minute follow-up telephone interview one week after that. Many practitioners will prefer the immediate warmth of the traditional face-to-face encounter for its associations and its proven benefits, but as we shall see, certain researchers have begun to explore such alternative virtual spaces as well.

The entire community stands to gain from this growing wealth of therapeutic options.

CONCLUSION

Nearly three decades after the first wave in change due to the home computer explosion, we can see that the mental health community's early concerns about low computer literacy and poor computer communication have turned out not to pose the expected barriers to therapeutic use. While the immense appeal of video games went on and caused a backlash among scholars who saw harm to their players, pioneering researchers have not harnessed the intrinsic motivation that they elicit to help treat ADHD, anxiety, and other psychiatric conditions. A second wave in change arrived with the advent of the internet, causing computers to be seen less as potential replacements for the therapist and more as conduits for therapeutic interactions (Wilkinson et al., 2008). The research and clinical potential for combining video games and the communicative possibilities of the internet are immense.

Future research into online video game therapy for mental health concerns might focus on two broad types of game: simple society games such as cards or chess, online versions of which are freely available, and elaborate online worlds such as massively multiplayer online role-playing games (MMORPGs), whose worldwide membership numbers is the millions. Both genres might be used for assessment and training purposes, and with an online chat component, both provide a limitless platform for social interaction that could be incorporated as part of the intervention program. Society games present the advantage of being accessible and enjoyable to players of all ages, while online worlds offer a unique opportunity for narrative content and immersive remote interaction with therapists and fellow patients. Congruent to Coyle et al. (2007), more collaborative efforts among therapists, engineers,

and computer software programmers to make such innovations more widely used.

KEY TERMS AND DEFINITIONS

Aggression: Is overt, often harmful, social interaction with the intention of inflicting damage or other unpleasantness upon another individual.

Anxiety Disorders: Are a category of mental disorders characterized by feelings of anxiety and fear, where anxiety is a worry about future events and fear is a reaction to current events.

Attention Deficit Hyperactivity Disorder (ADHD): Is a developmental neuropsychiatric disorder in which there are significant problems with executive functions that cause attention deficits, hyperactivity, or impulsiveness which is not appropriate for a person's age.

Autism: Is a neurodevelopmental disorder characterized by impaired social interaction, verbal and non-verbal communication, and restricted and repetitive behavior.

Commercial Video Games: Games that, in their original license, were not considered free-ware, but were re-released at a later date with a freeware license, sometimes as publicity for a forthcoming sequel or compilation release.

Game: A voluntary activity structured by rules, with a defined outcomes or other quantifiable feedback that facilitates reliable comparisons of in-player performances.

Personality Disorders: A class of mental disorders characterized by enduring maladaptive patterns of behavior, cognition, and inner experience, exhibited across many contexts and deviating markedly from those accepted by the individual's culture.

Psychosis: Refers to an abnormal condition of the mind, and is a generic psychiatric term for a

mental state often described as involving a “loss of contact with reality”.

Psychotherapy: Is the treatment of a person’s problems by (typically) conversing with another person.

Serious Game (or Applied Game): Is a game designed for a primary purpose other than pure entertainment.

Therapy: Is the attempted remediation of a health problem, usually following a diagnosis.

Video Game: Games that are designed for players to actively engage with their systems

and for these systems to, in turn, react to players’ agentive behaviors.

Leveraging the Arduino Platform to Develop Information Technology Devices

INTRODUCTION

Arduino is a famous board, which incorporates serial communication interfaces, including universal serial bus (USB), and an integrated development environment (IDE) based on Processing, a programming language that supports C and C++. It consists of a microcontroller with several other components that provide easy interconnections with other devices.

An increasing number of developers utilizes Arduino for projects related to information technology and its community is growing and expanding in different domains, areas and countries creating several opportunities both in research and within the market sector. It is not surprising that several start-ups have initiated their business basing their services on Arduino. If the reader browses Kickstarter¹, the world's largest funding platform for creative projects, he would notice that there have

DOI: 10.4018/978-1-5225-2255-3.ch285

been a number of successful projects revolving around the Arduino platform. Moreover, there are also many devices that are Arduino's compatible that represent information technology products where companies and individuals can exploit for their business.

A lot of information is today exchanged within the domain of home automation. Home automation is what makes houses getting smart giving the users the possibility to monitor it using an interface on their computer, tablet or smartphone, or even panels mounted around the house. More in detail, home automation involves the control and automation of lighting, heating, ventilation, air conditioning, appliances and security. With a simple push of a button or a voice command it is possible to control items around the house, setting up a lamp to turn on or off according to certain events, switching on or off particular appliances depending on specific actions, etc. It is even possible to check the operating status and power consumption of any appliances through the web when they are connected to the Internet. As there are very few world-wide accepted industry standards and the fact that the smart home space is heavily fragmented, today, thanks to the availability of tools such as Arduino, it is possible to easily design, build and use smart appliances self made. Sometimes, it is even possible to disassemble a certain device to see how it is made or getting its core and build around a desired sub-device that can provide functions not present within the original hardware. One example that we provide in this chapter is represented by a joystick used for video games that has been taken apart to see how it was designed and an Arduino board has been embedded to provide a mechanism that counts all the times a button is pressed or a certain position of the controller has been pushed. In fact, the signals and data that the sensors on top of Arduino collect can be easily stored in a database for further processing and analytics.

Arduino and its components have been studied during the class of Computer Architecture for the degree in Computer Science at the University of

Cagliari in 2016. At the end of the class, seven groups of students have chosen to carry out an information system prototype on top of Arduino and show their methodology and possible obstacles they encountered. Within their projects, students had to integrate Arduino with sensors of different kind, extract data from sensors and perform some operations on them, such as analytics or store them in a database for further processing. Information science and technology includes several software technologies but with the widespread of the Internet of Things, it is possible to collect data of several kind from the every object equipped with sensors. One of the goals was to let the young researchers understand the vast amount of data that is possible to gather using sensors embedded in the Arduino board.

The first two projects presented in this chapter integrate Arduino with temperature sensors, a LCD and a button that gives the option to switch among the different information the system reads from its sensors (temperature, humidity level, date and time). Data read from the sensors are stored using NoSQL approach (we have adopted Spark) and ready for visualization and quick analytics.

One more project has been focused on a security appliance to be used in houses: a photocell detects a light with certain intensity. If the intensity is greater (lower) than a fixed threshold, a relay is activated to turn on (off) an electric appliance. A shift register has been used to both leave free some pins of the Arduino board and to modularize the project. Two push buttons with a rotary encoder have also been adopted to easily change the threshold levels. Read values can be stored in a database.

A fourth project exploits Arduino's flexibility to create a joystick game controller within a case similar to the old fashion coin-operated entertainment machines typically installed in restaurants, bars and amusement arcades. The joystick is provided with USB connector and plug-and-play capabilities so that it can be recognized on the fly by a normal pc. Similarly, another project integrates Arduino with an analogic joystick game

controller and 8 different led lights. Each different movement of the joystick turns on one of the lights. The rationale behind this project is to replace led lights with smart appliances in a house so that them can be controlled with a joystick.

A sixth project uses Arduino for domotics. It allows an electric appliance to be turn on or off through a web interface.

A final project represents a sound intensity detector that can be embedded in any system where it is critical to perform any action after a certain sound intensity has been produced.

For all the projects it is straightforward to embed a module to store the read data from the sensors in a database for further processing, and analytics (e.g. through data mining techniques).

More info about the background, design, building process, usage and application of the developed smart prototypes will be detailed in the next remaining sections of the chapter.

Following the open source best practices, documentation and codes of these projects have been made online for free downloading and sharing in order to further contribute to the advancement and widespread usage of the Arduino platform. In some cases, videos have been taken so that the reader can have a deeper insight of the underlying project².

BACKGROUND

Arduino was born in Italy in 2004 when a Colombian student created the development platform Wiring as his Master's thesis project whose goal was to create a low cost tool for a wide range of users for digital projects.

The first Arduino was introduced in 2005 with the goal of providing an easy way, innovative and low-cost for a wide range of users for developing devices that could interact with their environment (such as robots, thermostats, motion detectors, etc.). In 2011 over 300 thousand official Arduinos were produced and in 2013 over 700 thousand official boards were at disposal of users.

The Arduino board is provided with an Atmel 8, 16 or 32 bit AVR microcontroller with other components for the integration in other circuits. Arduino's connectors allow the connection between the CPU board to a variety of add-on modules called shields. One handy feature of Arduino's microcontroller is the boot loader it is provided that simplifies the upload of programs on the chip flash memory. Figure 1 shows an Arduino board. As far as the software is concerned, the Arduino Integrated Development Environment (IDE) supports the programming languages C and C++. Every Arduino program consists of two functions that are compiled and linked into an executable cyclic program, *setup()* and *loop()*.

The setup function is used for initialization and runs once at the start of the program whereas the loop function is called continuously until the board is turned off.

Arduino is employed in a number of projects within several disciplines and it is often used and mentioned in research papers.

One domain that is experiencing to a quick widespread of the utilization of the Arduino framework is the home control and automation. Authors in Piyare, R., (2013) presented a novel architecture for low cost and flexible home control and monitoring system using Arduino. RESTful based web services have been used for the communication between the user and the home devices. The system allows any Android based smart phone with WiFi, 3G or 4G to access the system. To note that the proposed system does not require a dedicated server PC as many other current systems but it is hosted within Arduino itself and offers a novel communication protocol. One of the directions that the authors of the mentioned paper wanted to head was the Internet of Things (IoT). It is defined as a global network that links physical objects using network communications, web applications and cloud computing technologies. Within the IoT, devices can communicate, access, store and retrieve information from/to the Internet, interact with users and create smart and pervasive environment. Arduino can easily

Figure 1. An Arduino board with an RS-232 serial communication interface (upper left) and an Atmel ATmega8 microcontroller (black, lower right)³

read data from all kinds of sensors and is well suited for IoT for its simplicity and extensibility. Authors in Doukas, C., (2012) provided details and information needed to design and create IoT applications using the Arduino platform. They described cloud computing concepts, open platforms used to store sensor data on the cloud, how to connect Arduino with an Android phone and store/retrieve data through the Internet, and how to reprogram the Arduino microcontroller remotely through the cloud. One more example of adoption of the Arduino platform for home automation is represented by the work in David, N., A. Chima, A. Ugochukwu, & E. Obinna, (2015) where the authors presented a flexible home control and environmental monitoring system. A micro web server is hosted with the Arduino and Bluetooth technology is used for the communication between the remote user and the home devices. A similar work related to Arduino for home automation that takes into account security of the home providing a safeguard from possible intruders is represented by Chattoraj, S., (2015) where several sensors (temperature, humidity, smoke) are used and controlled by Arduino that acts as a master controller.

Another domain where the adoption of Arduino is rapidly increasing is the robotics. Authors in Warren, J., J. Adams, & H. Molle, (2011) de-

scribe Arduino to control a variety of different robots and provide detailed instructions on how to build them (e.g. GPA-enabled robot, robotic lawn mower, fighting bot, etc.). They mention and show different motors used in robotics and interfaced with Arduino.

More recently, authors in Araujo, A., D. Portugal, M. S. Couceiro, & R. P. Rocha, (2013) presented a full integration of compact educational mobile robotic platforms built around Arduino controller board in the Robotic Operating System (ROS). Even though most of robotic platforms provide open source software, there are important constraints that limit their diffusion and wide spread along the utilizers: (i) they require a slow learning curve and (ii) the hardware has limited capabilities. This was the rationale behind the development of a new robotic platform on top of Arduino. One more example within the robotic domain is represented by Broccia, G., M. Livesu, & R. Scateni, (2011). Here the authors proposed a cost-effective four-wheeled surveillance robot built using Arduino and a smartphone running Android. The hardware of the smartphone has been used for the robot purposes through the API offered by Android (e.g. GPS, video-camera, etc.). The robot could be remotely controlled with a PC connected to Internet.

Arduino has also been used in Jena, S. P., S. Aman, & R. Das, (2015) for data acquisition of green house environment. Multiple sensors were used (to measure things such as temperature, humidity, CO2 gas, soil moisture), connected to the Arduino with the goal of achieving an enhancement of growth in green house.

Arduino has been employed to develop game devices and video games as well. One pretty common example is represented by the famous Pong videogame that has been designed using the Arduino board. There are different versions of it Alberti, D., (2013), Arduino. TFT Pong. A different and more ambitious project is Arduboy. Arduboy (2015) is a game system powered by Arduino that had enormous success to raise funds in Kickstarter. Arduboy is a miniature open-source game 8-bit computer that contains all of the instructions, graphics, and sound to produce the game played on the device. Users can reprogram the Arduboy and change the games on it.

DEVELOPED PROTOTYPES

In this section we will describe in detail each information system prototype developed by each group of students for computer architecture, class held at

the first year of the degree of computer science at the University of Cagliari. It is impressive to note that thanks to the simplicity and flexibility of the Arduino platform, freshmen were able to design and create systems that can easily be installed in an environment to collect data of several kinds. They might even get commercialized and/or exploited for further opportunities.

Measuring Light Intensity, Temperature and Humidity With Arduino

Two systems have been built working with these sensors. The first includes a display showing the values of light intensity, temperature and humidity. It also uses the following components:

- Arduino board UNO,
- 16x9 LCD display,
- Humidity and temperature sensor DHT11,
- RTC module for data and time, and
- A potentiometer.

Figure 2 shows the schema of the system for all the connections. Software has been divided into three parts: (i) initialization of Arduino and

Figure 2. Connections of LCD display, DHT11 sensor, potentiometer, RTC module, and Arduino UNO board using Fritzing

inclusion of all the needed libraries; (ii) check of each component when they are on; (iii) print of information on the LCD display.

The other related project does not use the LCD display but sends the value read out of the sensors to a Web server that stores them in a NoSQL database and shows the results online in a dedicated web page. For such a project we have used:

- Arduino Uno,
- Arduino Ethernet Shield,
- DHT11 sensor,
- A resistor of 10 k Ω ,
- A photo-resistor,
- An Ethernet cable.

As shown in Figure 3, and as already discussed previously, digital and analogical inputs of Arduino have been connected with the sensors. Light intensity has been shown as a 10bits number (value between 0 and 1023). For the temperature and humidity we have adopted a digital DHT11 sensor. An Ethernet board compatible with Arduino has been used in order to send read data

to a PHP page that processes GET requests and stores results in a remote database.

Smart Management of Electric Appliances Using LCD Display

Components that have been used for the construction of this prototype are the following:

- Arduino Uno;
- 74HC595 Shift register;
- 16x2 LCD display, wired through the use of:
 - One NPN transistor;
 - A trimmer;
- Photo resistor;
- Relay;
- 2x Pushbuttons;

Arduino sends data to be visualized on the LCD display to the shift register through the pins *INPUT (14)*, *CLOCK (11)* and *REFRESH OUTPUT (12)*. The shift register performs a translation from serial to parallel and sends data through four of the eight pins of the LCD display.

Figure 3. The schema of the light intensity, temperature and humidity sensors linked to Arduino and the Arduino Ethernet board using Fritzing

Moreover, it uses one pin of the NPN transistor to securely control the backlight of the LCD display. The reader is invited to check Figure 4 for the schema of the LCD display. Pins directly used by the shift register to send data to the LCD display are: *RS*, *E*, *R/W*, *D4-D7*, and *K* for controlling the backlight. The shift register is not essential but it has been employed to reduce the number of pins directly used on the Arduino. Without it, the Arduino would have been connected directly to the LCD using eight pins (as mentioned above). After describing the procedure how the data are sent and shown on the LCD display, let us move on with the other components. Figure 5 shows the schema of the used shift register.

The photo resistor is a light-controlled variable resistor. The resistance of a photoresistor decreases with increasing incident light intensity; in other words, it exhibits photoconductivity. It is connected to the analogic pin of Arduino with a push down resistor. Arduino reads through the pin connected to the photo resistor a value ranging from 0 to 1023, which indicates the intensity

of the light in the environment. A value closer to 0 means absence of light whereas a value closer to 1023 indicates the highest intensity. A value between 600 and 800 indicates acceptable indoor light. Just to get an idea on real settings, solar light has a value closer to 950. A default value of 650 is used as threshold of the system. When the light has an intensity value greater or equal than the threshold the system is activated, otherwise it is turned off.

The two push buttons are connected in a pull down configuration to two interrupt pins of the Arduino board. They start two interrupt routines whose purpose is to increase or decrease the threshold value for the intensity of light that enables the system.

Finally, a 5V relay is connected to a digital pin of Arduino and it is enabled when the intensity of light is below the threshold. The relay is connected to a lamp or any other electric appliance having a power in compliance with that supported by the relay.

Figure 4. The 16x2 LCD display and its pins employed for the prototype

Figure 5. 595 Shift register and its schema

As far as the software is concerned, the LiquidCrystal595 Arduino Library has been employed for driving the LCD instead of the classic LiquidCrystal because of the presence of the Shift Register, this library also permits to manage the backlight of the LCD without any additional configuration.

Figure 6 shows the assembled prototype.

It is important to note that the schema presented in this subsection does not change at all if we replace the photo resistor with any other sensor (e.g. temperature, humidity, etc.) in order to control the electric appliance connected to the relay according to the temperature or humidity of the environment.

An Arcade Game Controller

The second prototype we describe consists in an arcade game controller developed to play video games in any PC. Components that we have employed for the design process were the following:

- Arduino Leonardo Microcontroller;
- Components from the Arduino Starter Kit;
- BreadBoard;
- 4 semi-transparent arcade game buttons with mechanical switch (bought on eBay);
- 4 leds (2 red from the Arduino Starter Kit and 2 white bought separately);

- A home-made wooden case we built.

The core of the game controller lies on Arduino itself. The raw input signals are acquired from the buttons and sent to the Arduino board, then translated into keyboard signals and sent to the pc through the USB cable.

Each of the 4 buttons has 2 connectors for the switch and 2 connectors to light up the led inside each button. Whenever a button is pressed, its led is turned on. Each button is connected to the breadboard to allow a more precise circuit mapping. No additional resistors are necessary, only the built-in pull-up resistors inside the breadboard.

The Arduino board has been programmed to emulate a common plug & play USB keyboard. We have leveraged the *keyboard.h* library, in order to be compatible with every computer and OS (we have tested it on a Windows, Linux and Mac machine). We made sure the ghosting effect⁴ does not occur, and therefore all the 4 buttons can be pressed and recognized at the same time without any issues.

The code initializes (in the *setup* function) the status of the 4 pins related to the four buttons, setting them as inputs and 4 pins as output to light up the led lights. The *loop* function is executed every few milliseconds to accurately acquire any push of each button. This function checks at every

Figure 6. The assembled prototype for smart management of electric appliances

G

loop if a button is pressed; if this happens, the main board sends to the PC the corresponding keyboard signal. In the meantime the main board also sets to “high” the status of the pin associated with the button, lighting up the led inside

the corresponding button. As long as the button is pressed the board continues to send the same signal, and keeps the led on. Figure 7 shows the case and the assembled components.

Figure 7. The case (bottom right) and the assembled components of the arcade game controller prototype

A Sound Intensity Detector

In this third prototype, Arduino has been connected with an acoustic sensor to detect sounds whose intensity is higher than a chosen threshold. If it is then a led is turned on. There are several applications of such a schema to be used in homes: e.g. baby crying detector, dog bark detector, etc. The adopted acoustic sensor has a microphone, seven resistors (one of them is variable), a LM939 module and two led lights. It is possible to set the sound intensity level to detect by tightening a screw of the embedded potentiometer. When the microphone detects a sound intensity value higher than the threshold level, a HIGH signal will be produced on the DO pin. Otherwise, a LOW signal will be propagated. Figure 8 shows the schema of the prototype (Arduino's connections with the acoustic sensor, the LED, and the resistor). More in detail, the acoustic sensor is connected to Arduino through three pins: DO, digital exit, to the pin 8.

Vcc and GND connected, respectively, to the 5V and GND pins. Once the system is connected to either USB or to a power supply it is active and ready to listen. If a sound with intensity greater than the threshold is detected, the LED is turned on for a second. For the next five seconds, the system is in pause and, right after, it comes back to active and ready to listen.

Management of Electric Appliances Through Web Services

This project aims at turning on and off electric appliances through a simple web interface. The extra modules we have used are: Arduino Ethernet Shield and the Relay module. The former allows linking an Arduino board with a PC or an Internet router therefore creating a web server in order to manage all the digital ports of Arduino. The latter includes two relays connected to a digital port of Arduino that will command to turn on or off the

Figure 8. The schema of the sound intensity detector using Fritzing⁵

electrical appliances connected to one endpoints of the relay. Other tools we have used are:

- 512MB MicroSD,
- Ethernet cable,
- 2 x relay,
- lamp,
- paper box.

A web page has been developed within the microSD of the Ethernet Shield board and other code for the Arduino main functions lets the web server wait the requests on the IP address indi-

cated in the configuration. Figure 9 shows the components used for such a project.

G

Analog Stick with Arduino

Components we have used for such a prototype are:

- Arduino UNO board,
- Breadboard,
- Analog stick,
- Eight 220 Ω resistors,
- Eight led lights (4 red and 4 blue), and
- A power bank as power supply.

Figure 9. Components used for the project

The rationale of the software developed on top of Arduino is to detect the x-y position of the analog stick and turning on the correspondent led light. Instead of the led lights, electric appliances might be connected and turned on or off using the stick. Figure 10 shows the connections of all the components used for this prototype where the reader may observe the top left red led light on when the user moves the stick toward the corresponding direction.

FUTURE RESEARCH DIRECTIONS

There are plenty of ideas to be implemented that stimulate us. For example, there are several smart components that can be designed, programmed and used in homes and connected with Internet and managed through smart phone applications whose data can be gathered for plenty of analysis. Definitely, the most stimulating of them is within the robotics domain. In fact, as future directions where we are headed we would like to develop on top of Arduino a robotic platform provided with several sensors (temperature, camera, humidity, acoustic), wheels to move on a flat surface, arms

to pick up objects, move and perform general. One advanced version will have a humanoid shape and will be provided of legs instead of the wheels. We want to also provide the robot with a basic artificial intelligence so that it can perform basic actions depending on the context. Last but not least, we want to come up with a set of API to access to all the sensors and functionalities of the robot so that everyone can build the same robot (we will publish the manual and data sheets of each component we will be using) and program software that can interface with all the robot capabilities. We would like to keep the project open source and follow its best practices.

CONCLUSION

Arduino is a platform that easily allows the development and integration of hardware in any domain. It can be used to easily collect data and information from any sensor and store them in cluster for further (big data) processing. In this chapter we have described a set of applications and prototypes developed on top of Arduino for different domains where data can be extracted

Figure 10. Breadboard and all the components for the analog stick built with Arduino

and analyzed for further processing. The ease of design and development of so many sensors and opportunity to extract data paves the way for start-up/spin-off opportunity creation that sell as business core products developed with Arduino or even consulting and training for the use of Arduino and its tools. We aim at creating such a start-up with skills in creating and positioning sensors, extract and store data in databases and perform analytics on them.

KEY TERMS AND DEFINITIONS

Arduino Board: Open source board provided with Atmel 8, 16 or 32 bit AVR microcontroller with other components used to program for development and embedding in other systems.

Arduboy: A credit card sized game system developed using Arduino whose cost is \$39. The original project was funded through Kickstarter.

Breadboard: It is a solderless device for prototyping of electronics and test circuit designs. Most electronic components in electronic circuits can be interconnected by inserting their leads or terminals into the holes and then making connections through wires where appropriate. The breadboard has strips of metal underneath the board and connect the holes on the top of the board.

Fritzing: Open source hardware initiative that makes electronics accessible as creative material for everyone.

Ghosting: Effect appearing in some models of keyboards when some key combinations pressed together cause some keypresses to disappear, although they are physically pressed.

Internet of Things: A development of the Internet where common objects have network connection and send and receive data.

Kickstarter: The world's largest crowdfunding platform for creative projects developed by an American corporation based in Brooklyn, New York.

NoSQL Approaches: Provide a mechanism for storage and retrieval of data without using a predefined schema as that present in relational databases. NoSQL indicates non relational.

Restful Web Services: Software architectural style of the World Wide Web that specifies constraints that if applied to a web service induce desirable properties. Data and functionality are resources accessed using Uniform Resource Identifiers.

Educational Serious Games Design

Ilias Karasavvidis

University of Thessaly, Greece

INTRODUCTION

Initially, digital games targeted mainly entertainment. The idea of combining fun and learning led to edutainment, the pairing of entertainment with education. The latest trend, serious games, marginalize entertainment and brings education into the spotlight. Serious games are games not exclusively designed for fun, serving non-entertainment goals in many diverse fields such as military, government, corporate, health-care, and education (Michael & Chen, 2006).

Digital games have become a defining phenomenon of contemporary culture. Over the last two decades, the educational interest in digital games has skyrocketed. This interest has taken two main forms. First, game-based learning that is entertainment-driven. This trend involves the use of commercial games for learning. Second, education-driven game-based learning that is currently manifested in trends such as gamification and serious games. The former refers to the application of game design elements to educational settings (Deterding, Khaled, Nacke, & Dixon, 2011; Kapp, 2012). The latter refers to the ad hoc development of games that bring education into the spotlight without excluding entertainment. Serious games are games not exclusively designed for fun, serving non-entertainment goals in many diverse fields such as military, government, corporate, health-care, and education (Michael & Chen, 2006).

Game design is an inherently interdisciplinary endeavor, involving experts from various disciplines such as graphic, audio, product, and interaction design, programming, animation, writing, and content area expertise (Salen, 2007). The game industry has developed highly sophisticated

narrative, artistic, and technical methodologies for creating engaging and immersive games (e.g. Salen & Zimmerman, 2004; Schell, 2014; Adams, 2010). Currently, the field of digital game design is mature, being in a paradigm state (Kuhn, 1996).

As the emphasis has gradually shifted to serious games, however, new requirements emerged. Compared to traditional digital game design, the main complication that emerges in the case of Serious Game Design (SGD) is that learning has priority over entertainment. Consequently, in addition to all other types of expertise required for digital game design, SGD necessitates professionals whose expertise is related to learning. Such professionals include educators, content experts, and learning sciences professionals in general. To design effective serious games, game design professionals would need to collaborate with learning sciences professionals (Charsky, 2010; Lim et al., 2014; El Mawas, 2014). Such a collaboration, however, might not be directly possible because a common vocabulary is missing (Arnab et al., 2014). As it has been stressed, the main limitation characterizing the field of serious game design pertains to the disconnect between established game development models and the design of learning (Arnab et al, 2014; Bellotti, Berta, De Gloria, D'ursi & Fiore, 2012; Van Staalduinen & de Freitas, 2011). To address this limitation, Moreno-Ger et al., (2014) argued that serious game development methodologies are needed that will eventually help systematize the creation of games. To bridge the game design - educational design gap, a number of serious game design models have been advanced over the past few years. To date, there has been no systematic review of such SGD models. Consequently, the extent to which these models address the major

DOI: 10.4018/978-1-5225-2255-3.ch286

challenges the field of SGD faces is unknown. The present work has two main objectives. First, it presents the state of the art in SGD by briefly introducing 13 models. Second, it acknowledges contribution these models make and identifies 5 principal challenges that remain open for the field of SGD. The chapter is concluded with an examination of the extent to which every model meets the design challenges and an outline of the road map ahead.

BACKGROUND: SERIOUS GAME DESIGN MODELS – STATE OF THE ART

In this section 13 SGD models that have been advanced in recent years are briefly introduced. An overview of the models is given in table 1.

While all models aim at SGD, they have different origins and constitute different solutions to the problem of design. For convenience, the SGD models are presented in chronological order.

Table 1. An overview of SGD models

Model	Sources	Features
Experiential Gaming Model (EGM)	Kiili (2005)	experiential learning influence; links gameplay with experiential learning
4 Dimensional Framework (4DF)	De Freitas & Oliver (2006); De Freitas & Jarvis (2009)	provides 4 dimensions for game design: learner, pedagogy, representation, and context
Game Object Model (GOM), GOM II	Amory & Seagram (2003); Amory (2007)	object-oriented programming influence; game components are described in terms of abstract (pedagogical) and concrete (design) interfaces
Document-Oriented Design and Development for Experiential Learning (DODDEL)	McMahon (2009)	extension of a generic ADDIE model comprising of the following stages: situation analysis, design proposal, design documentation, production documentation, prototype, development, and implementation
Is	Annetta (2010)	encapsulated model comprised of 6 elements: identity, immersion, interactivity, increasing complexity, informed teaching, and instructional
Game-Based Learning framework (GBLF)	Van Staalduinen & de Freitas (2011)	4DF extension with 25 game elements that improve memory and learning
Design Patterns Framework (DPF)	Kelle, Klemke & Specht (2011)	4 step procedure for mapping game design patterns on teaching and learning functions
Game Discourse Analysis (GDA)	Wouters, Oostendorp, Boonekamp & Spek (2011)	uses (a) information flow (resources needed in the game) and (b) game discourse (presentation of resources in the game) to inform game design
Six Facets Framework (SFF)	Marne, Wisdom, Huynh-Kim-Bang & Labat (2012)	6 design elements: pedagogical objectives, domain simulation, interactions with the simulation, problems and progression, decorum, conditions of use
Architecture for Representations, Games, Interactions, and Learning among Experts (ARGILE)	El Mawas (2014)	design methodology that employs Web 2.0 practices for SGs
Learning Mechanics – Game Mechanics (LM-GM)	Arnab et al., (2014); Lim et al., (2013); Lim et al., (2014)	associates ludic elements (game mechanics) with pedagogy (learning mechanics)
Cognitive Behavioral Game Design Model (CBGD)	Starks (2014)	Social Cognitive theory and Flow theory influences; combines (a) social cognitive elements and (b) multiple intelligences elements to promote flow
Activity Theory-based Model of Serious Games (ATMSG)	(Carvalho et al., 2015)	Activity Theory influence; extension of the GM-LM model that distinguishes 3 types of activity: (a) learning, (b) gaming, and (c) instructional; each activity type is further represented in terms of actions

Kiili, (2005) proposed the Experiential Gaming Model (EGM) for designing SGs. The EGM is based on Kolb's experiential learning cycle and the corresponding four stages of experiential learning. The starting point for the development of this model was the observation that the creation of educational games often fails because the emphasis on educational dimensions of games has displaced fun, resulting in unengaging games. The main idea underlying the EGM is that the link of gameplay with experiential learning will facilitate the state of flow and, eventually, lead to learning.

De Freitas & Oliver (2006) (also de Freitas & Jarvis, 2009) advanced the 4 Dimensional Framework (4DF) for the design of SGs. The framework comprises 4 main dimensions which can be employed to guide game design: learner, pedagogy, representation, and context. While this framework was initially conceptualized for classifying educational games, the authors have eventually adapted it for game design.

The Game Object Model (GOM) for SG design was proposed by Amory & Seagram (2003). The GOM attempts to describe the relationship between game elements and pedagogical dimensions of learning. The model draws on object-oriented programming (OOP) concepts such as classes, encapsulation, and inheritance. GOM II (Amory, 2007) is the updated version, aimed to enrich the initial GOM. The GOM considers educational games as consisting of components (objects) each of which is described in terms of abstract and concrete interfaces. Abstract interfaces refer to pedagogical and theoretical constructs (conceptualization phase) while concrete interfaces refer to design elements (design phase).

McMahon (2009) introduced the Document-Oriented Design and Development for Experiential Learning (DODDEL) model. DODDEL was developed for the purposes of an undergraduate course on game design and is an extension of the generic ADDIE model (i.e. Analyse, Design, Develop, Implement, and Evaluate – ADDIE). The DODDEL comprises several discrete design and development stages: situation analysis,

design proposal, design documentation, production documentation, prototype, development, and implementation.

Annetta (2010) proposed Is, a framework for serious educational game design that comprises six elements: identity, immersion, interactivity, increasing complexity, informed teaching, and instructional (all start with an I). In this framework the elements are nested, so the top element (instructional) encapsulates all others down the stack.

The Design Patterns framework (DPF) has been advanced by Kelle, Klemke & Specht (2011). This work constitutes more of a framework rather than a concrete development model. The DPF emerged in response to the need of mapping game design patterns onto educational methods. The authors draw on the idea of Design Patterns as the building blocks of a game and propose a 4 step procedure for mapping design patterns on teaching and learning functions.

The Game-Based Learning framework (GBLF) (Van Staaldin & de Freitas, 2011) was conceptualized as an extension of the aforementioned 4DF. The authors reviewed the literature and identified 25 game elements that improve memory and learning. They have then integrated these game elements into the four dimensions of the 4DF. The resulting framework explicitly incorporates learning, instruction, and assessment as core elements.

Wouters, Oostendorp, Boonekamp & Spek (2011) introduced the Game Discourse Analysis model (GDA). The authors introduce the concepts of information flow and game discourse. The former describes the information resources needed in a game while the latter pertains to how the resources can be presented in the game. The GDA model is proposed as a method for supporting designers in the game making process with respect to information flow and game discourse. The model comprises 3 main components that center on the information flow: (a) building blocks, which describe the information resources required to materialize a task in the game, (b) standardized description of the information flow, and (c) manipulation, which denotes the creation

of a game discourse through the information flow. This model utilizes constructs from cognitive psychology, such as cognitive task analysis (CTA), to explicitly inform game design.

Marne et al., (2012) developed the Six Facet Framework (SFF), a conceptual framework that allows all game design stakeholders (game experts and pedagogical experts) to speak a common language and work together in designing games. The main drive behind this framework is the communication problem between the two types of experts that are involved in SG design. The framework includes the following elements (facets) of design: (a) pedagogical objectives, (b) domain simulation, (c) interactions with the simulation, (d) problems and progression, (e) decorum, and (f) conditions of use. The authors developed a design pattern library consisting of 42 design patterns within the SFF. This model represents a systematic attempt to bridge formal game design and pedagogy design. While it is principally conceived as a means to foster interdisciplinary collaboration, the SFF is also helpful as a general purpose design guide due to the comprehensive library of design patterns.

The ARGILE model (Architecture for Representations, Games, Interactions, and Learning among Experts) (El Mawas, 2014) is mainly a methodology for the design of participatory and knowledge-intensive SGs. ARGILE constitutes a participatory architecture for the co-design of games by designers, experts, and players. This model attempts to extend Web 2.0 practices to game design practices through co-design.

The Learning Mechanics-Game Mechanics Model (LM-GM) for SG design has been described in a number of recent publications by a large international team (Arnab et al., 2014; Lim et al., 2013). The model was explicitly conceptualized so as to bridge the most challenging gap in the field: the SG design and educational design gap. The LM-GM model provides a means to relate pedagogy to ludic elements. The core elements of the LM-GM model are Serious Game Mechanics (SGMs) and the Mechanics of Learning (LM). The LM-GM model maps game mechanics onto learning mechanics in considerable detail. Interest-

ingly, Lim et al., (2014) have extended the LM-GM model by integrating narrative elements through Narrative Serious Game Mechanics (NSGM).

Starks (2014) introduced the Cognitive Behavioral Game Design Model (CBGD). The main argument behind CBGD is that game design should make more systematic use of established psychological theory. Consequently, CBGD draws on (a) Bandura's Social Cognitive Theory (SCT), (b) Gardner's Theory of Multiple Intelligences (MI) and (c) the enjoyment process. The CBGD model involves the use of social cognitive elements (i.e. knowledge, goals, outcomes, encouragement, and barriers) through the mechanisms of multiple intelligences elements (e.g. graphics, narrative, space, sound etc), so as to promote enjoyment in terms of engagement, challenge, flow, persistence, and mastery.

Lastly, The Activity Theory-based Model of Serious Games (ATMSG) (Carvalho et al., 2015) is an extension of the GM-LM model. It targets the problem of how concrete game components need to be structured to foster learning. Based on Activity Theory, the model adopts the concept of activity and its hierarchical structure and organization. Consequently, the model proposes 3 main types of activity: (a) gaming activity, (b) learning activity, and (c) instructional activity. Each activity type consists of separate actions. As Carvalho et al., (2015) argue, actions can be represented as triangles, each depicting how a subject achieves a goal using a tool. Game components are defined as actions forming subject-tool-goal triangles. Drawing upon this definition, the authors introduce a serious games taxonomy made up of three types of components: gaming, learning, and instructional ones.

FURTHER RESEARCH DIRECTIONS: PRINCIPAL CHALLENGES FOR SERIOUS GAME DESIGN

Overall, these models are clear evidence of the solid progress made over the last decade in terms of conceptualizing SGD. While each model has

it own unique merits, all the SGD models make important contributions to the field. As a whole, the models represent a rich and diverse set of solutions to the problem of SGD, helping piece the whole puzzle together. Despite progress, however, important issues remain unresolved. The core problem is how to bring two different professional communities together. More specifically, to design effective serious games, the expertise of educators, content experts, and learning experts will need to be utilized on the top of all other experts who are typically involved in game design. To advance as a field, SGD will need to facilitate the collaboration among experts from different disciplines. In practical terms, this involves bridging the gap between game design and learning design. Considering the state of the art in SGD as reflected in the models, we argue that the road map for advancing the field requires the community to address the five principal challenges outlined in Table 2.

The first challenge is how to integrate content into games. Learning is about academic content, so the design of serious games requires ways to integrate content into the games. Academic content cannot be embedded into games in the ways it is done in textbooks, i.e. in expository form. Content needs to be adapted, and embedded in the game in specific ways. Preserving fun while promoting learning seamlessly, requires intrinsic content integration into the game (Sanchez, 2011; Malone, 1981). The seamless content integration into games entails that distinguishing the learning

from the fun becomes difficult (Charsky, 2010). Preliminary evidence suggests that intrinsic integration into content might be essential for learning from games (Habgood & Ainsworth, 2011; Dickey, 2011).

The second major challenge is how to take into consideration students' ideas and conceptions of content when adapting and integrating content into serious games. For instance, as the Science education literature suggests, students have intuitive ideas about most physical phenomena (Driver, Asoko, Leach, Scott, & Mortimer, 1994; Smith, Disessa, & Roschelle 1994). Such ideas are often not in agreement with the established scientific viewpoint. As research has indicated, such intuitive conceptions influence learning and cannot be ignored (Duit, Treagust, 2003; Vosniadou, Ioannides, Dimitrakopoulou, Papademetriou, 2001).

The third challenge involves determining how to utilize instructional design theory to inform SGD. Mayer (2011) argues that to design serious games, we need to combine two fields: the science of instruction and the science of learning. As he puts it, the challenge is to find the proper mix between game and instructional features. One of the requirements mentioned is a science of instruction. The genuine challenge, however, is to translate the principles outlined in Mayer (2011; 2014) into actual game design methods since a direct translation might not be possible.

The fourth challenge is to examine how people learn (e.g. Bransford, Brown & Cocking, 2000) and utilize this body of knowledge for the purposes of SGD. Engineering learning as opposed to engineering entertainment is what differentiates games for entertainment from serious games. Therefore, learning theory and research will need to be translated into ludic approaches so as to be effectively integrated into games. Inversely, ludic approaches will need to be combined with learning theory and research. While it has been illustrated that game designers intuitively employ learning principles when creating games (Gee, 2003), a more systematic approach will have to be followed.

Table 2. Principal design challenges for the SGD field

N	Design Challenges
1	Integrate content
2	Address student ideas
3	Engineer instruction
4	Engineer learning
5	Conceptualize learning

As an extension of the previous one, the final challenge is related to the conceptualization of learning per se. While some SGD models have turned to instructional design theory for solutions, it should be noted that instruction is merely a means to an end. The end goal of all instruction is learning: instruction should simply be instrumental in facilitating it. As opposed to looking at the field of instructional design for inspiration, learning will need to be approached in a more principled way. We argue that effective SGD calls for both an empirically and theoretically grounded conceptualization of learning. Regarding the former, SGD needs to be founded on solid principles of learning. Mayer (2011) stressed the need for a science of learning for game design, specifically advocating the use of Multimedia Learning Theory (MLT) principles for informing SGD. We would extend this argument to include empirical research from the learning sciences at large. Regarding the latter, what is required is a concrete, coherent, and comprehensive conceptualization of learning for the purposes of SGD. Such an all-encompassing conceptualization will need to account for learning in terms of content, context, social interaction, and mediational artifacts. We argue that such a conceptualization will provide a much-needed framework for bridging traditional game elements with learning theory.

The extent to which the SGD models meet each of the 5 principal design challenges is presented in Table 3.

Several interesting conclusions can be drawn from the table. First, none of the models addresses all 5 challenges. However, six models (4DF, GBLF, SFF, LM-GM, CDBGD, and ATMSG) appear to be more comprehensive than others considering that they simultaneously meet several challenges. Second, the degree to which each SGD model addresses a specific challenge varies considerably: some of the models might fully address a challenge while others only tangentially. For instance, both the EGM and the ATMSG models adopt certain notions of learning but the latter approaches learning in a more principled manner. Third, no

Table 3. How SGD models meet the design challenges

Design Challenge Met	Serious Games Design Models
4	Experiential Gaming Model (EGM)
1, 3, 4	4 Dimensional Framework (4DF)
3, 4	Game Object Model (GOM), GOM II
1, 4	Document-Oriented Design and Development for Experiential Learning (DODDEL)
3, 4	Is
1, 3, 4	Game-Based Learning framework (GBLF)
3, 4	Design Patterns Framework (DPF)
3, 4	Game Discourse Analysis (GDA)
1, 3, 4	Six Facets Framework (SFF)
3, 4	Architecture for Representations, Games, Interactions, and Learning among Experts (ARGILE)
1, 3, 4	Learning Mechanics – Game Mechanics (LM-GM)
1, 3, 4	Cognitive Behavioral Game Design Model (CDBGD)
1, 3, 4	Activity Theory-based Model of Serious Games (ATMSG)

uniformity should be implied in how the different SGD models approach the same design problem. The models overcome a specific design challenge in different ways depending on their origin, goal, and overall approach. Models such as the EGM approach the issue of academic content integration in different terms compared to the LM-GM model. Fourth, the majority of the models draw rely heavily on psychology (for learning) and education (for instruction). Finally, the SGD models examined have placed virtually no importance on student ideas (2nd challenge) and conceptualization of learning (5th challenge). None of the models explicitly approaches the issue of previous student knowledge and how it might facilitate or hinder learning from the game. Similarly, all models fall short in terms of adopting a concrete, coherent, and comprehensive conceptualization of learning for ludic purposes.

CONCLUSION

As noted in the introductory section, the field of game design is in a paradigm state. A decade ago Gunter, Kenny and Vick, (2006) argued that a new game design paradigm is required for the field of SGD. Despite the considerable progress made, this conclusion still holds as the field of SGD is currently in a pre-paradigm state (Kuhn, 1996). It is imperative that the game design and the learning sciences communities join forces to bridge the game design and learning design gap. To advance the field to a paradigm state, the two communities will have to rise up to the five principal design challenges.

KEY TERMS AND DEFINITIONS

Digital Game: A game whose system is (partly or wholly) implemented in a digital device such as a game console, a personal computer, a smart-phone or tablet.

Game: A system in which participants compete to achieve a clearly identifiable result. The system is made up of interrelated components whose relations are rule-governed.

Game Design: The art and science involved in making all the necessary decisions for creating a game.

Ludic Elements: Game components that refer to player engagement and represent the entertainment dimension of a game.

Pedagogical Elements: Game components refer to the curricular, instructional and learning dimensions of a serious game.

Serious Game: A game that is not exclusively designed for fun, serving primarily non-entertainment goals in various fields such as education, health-care, corporate etc.

Serious Game Design: The art and science of making all the necessary decisions for creating a game that does not foreground entertainment.

Serious Game Design Models: Conceptualizations that aim to inform the decision-making processes involved in creating a serious game.

Exposure to Video Games and Decision Making

INTRODUCTION

In the last decade, the playing of video games (VGs) has become very popular among people. Video games represent a pervasive leisure activity beginning in middle childhood and continuing through adulthood (Gentile et al., 2004; Kubitzki, 2005). Population based surveys indicate that average gaming time ranges between 7 and 13 hs per week in both children and adolescents (Gentile and Anderson, 2003), and this value may underestimate the prevalence of use in some population segments. This high level of VGs consumption highlights the relevance for a clearer understanding of the potential influences of video game experience on human behaviour and cognition (Bioulac et al., 2008; Green and Bavelier, 2006).

Indeed, after several dramatic and murderous shoot-outs happened mainly in schools and colleges, game research focused mostly on the impact of aggressive shooter games on aggression-related cognitions, affects, and behaviors (Anderson and Bushman, 2001). The studies present in the literature showed different risks of excessive exposure to VGs: increase in aggression (Anderson et al., 2010), emergence of attention problem (Swing et al., 2010) and hyperactivity (Gupta et al., 1994), poor academic performance (Rideout et al., 2007), possible addiction (King et al., 2011), mood troubles as depression and anxiety (Mentzoni et

al., 2011), reduction of empathy (Bartholomew et al., 2005), impairment of social behavior (Gentile et al., 2011), reduction of sleep time, quality and efficiency (Weaver et al., 2010; King et al., 2013).

However, exposure to VGs can not be regarded only as a negative experience. A great body of literature has revealed that action video game players, compared to non video game players, can develop broader cognitive benefits from extensive playing. These benefits include visual acuity (Green and Bavelier, 2007; Wu and Spance, 2013; Granic et al., 2014), attention flexibility (Green and Bavelier, 2003; Cain et al., 2012), stimulus-response mapping (Clark et al., 1987; Castel et al., 2005), encoding speed (Wilms et al., 2013), and executive functioning (Strobach et al., 2012). Extensive experience playing action VGs can even affect memory for the stimuli presented in a very short period (e.g., iconic memory and visual working memory), resulting in better accuracy (Boot et al., 2008; Blacker and Curby, 2013), higher precision (Sungur and Boduroglu, 2012) and more efficient strategy in retrieving information (Clark et al., 2011).

At the present, only a few studies have investigated the potential effects of video game exposure on decision making. The aim of the present chapter is to describe this relation, reviewing published studies and discussing possible implications for future research.

BACKGROUND

1. Exposure to Video Game and Decision Making

The study of the VGs effects on decision-making is a new research field in psychology, with a limited number of published studies; nevertheless, it can offer important clues for understanding risks and potentialities.

Past research has demonstrated that VGs experience can influence cognition and emotion (West and Bailey, 2013). More specifically, the prolonged exposition to VG is associated with decreased use of proactive cognitive control (Kronenberger et al., 2005; Mathews et al., 2005; Bailey et al., 2010), changes in feeling and expressing both positive and negative affects (Bartholow et al., 2006; Kirsh and Mounts, 2007; Bailey et al., 2011). Since it is well known that the efficacy of decision making is modulated by emotion, executive/cognitive control, and by presence of chemical and behavioural addiction (Weber and Johnson, 2009; Figner and Weber, 2011), one could expect that VGs experience could have a detrimental effect on the efficacy of this complex process.

It has been demonstrated that exposure to racing VGs can influence real-world decision making related to driving behavior (Fischer et al., 2009; Beullens et al., 2011). There is evidence, however, that certain types of VGs may have differential effects on cognitive control, a set of abilities that allow the individual to maintain goal-directed information processing (Basak et al., 2008; Bailey et al., 2010). For example, in a study focused on individual differences (Bailey et al., 2010) it has been reported that experience with First Person Shooter (FPS) video games was correlated with a reduction in proactive control (active, sustained maintenance of goal-relevant information) and was not correlated with reactive control (just-in-time mobilization of control after the conflict is detected; Braver, 2012). Further-

more, Swing (2012) demonstrated that 10 hs of FPS experience resulted in a reduction in the use of proactive control in a training study. These findings may indicate that FPS gamers may be more likely to make their decisions immediately rather than after thoughtful deliberation, a tendency that could indicate a preference for immediate rewards rather than long-term assessment of the risks and benefits (Bailey et al., 2013).

In contrast to FPS games, strategy VGs may promote an increase in careful planning and executive control of behavior. Basak and coworkers (2008) demonstrated that more than 23 hs of training with strategy VGs improved task-switching and working memory abilities, that are cognitive processes relevant for the efficacy of decision making.

A study proposed by Bailey and colleagues (2013) examined the relationship between two of the most popular genres of video games (FPS and strategy) and decision making. The main purpose was to provide a more comprehensive understanding of how VGs experience is related to risky decision making. By measuring both behavioral and self-reported impulsivity, it emerged that pathological gaming and playing FPS games were positively associated with a greater impulsivity. This association sounds very interesting, supporting the evidence that this form of gaming is also associated with a reduction in the use of proactive cognitive control (Bailey, 2009; Bailey et al., 2010; Swing, 2012). Taken together these results may indicate that playing FPS games and pathological gaming are associated with an increase in impulsive behavior that results from a decrease in the use of proactive cognitive control of behavior (Bailey et al., 2013). Also, the association between gaming and risky decisions was sensitive to game genre: the number of hours spent to playing VGs and to be a FPS gamer negatively correlated with the tendency to select low risk options. These findings provide a clear evidence that gaming time, pathology, and game genre

(i.e., FPS) influence the individual's selection of risky options, and that such a behavior continues in spite of its detrimental effect on performance.

In contrast to FPS type, strategy VGs were not strongly related to increased risk-taking. One explanation for the differential influence of game genre is that there could be social repercussions for making impulsive decisions in a strategy game, where a successful performance requires cooperation within a team (Bailey et al., 2013). It is important to note, in fact, that both strategy and FPS games are associated with pathological gaming, but the consequences of impulsivity and risk-taking are not the same for the two genres. This may be due to the structure of the gaming environment or to player's goals within the different genres.

It has also provided an preliminary evidence of a negative association between playing violent VGs and prosocial behavior (Anderson & Bushman, 2001; Ballard & Lineberger, 1999; Wiegman & VanSchie, 1998). According to the General Aggression Model (GAM; Anderson & Bushman, 2002), pro- and anti- social behaviors may be affected by the activation of aggression-related patterns that are stored in memory after exposure to VGs. Such patterns can alter the way in which subsequent information is processed, so that even neutral or ambiguous cues may be interpreted as threatening or aggressive. Consequently, the activation of aggression-related patterns may alter appraisal and decision-making processes, ultimately leading to more antisocial (and, conversely, fewer prosocial) behaviors. Based on this idea, Sheese and Graziano (2005) carried out an experiment aiming at investigating the effect of VGs violence on cooperative decision making. Participants were divided in pair and randomly assigned to play either a violent or a nonviolent version of a famous VG. Following the VG exposure, participants were separated and had the opportunity to choose to cooperate with their partner for mutual gain, withdraw from the interaction, or exploit their partner for their own benefit. Results showed that playing violent

VGs affects subsequent decisions to cooperate or compete with other individuals in high-stakes situations, undermining prosocial and altruistic motivation by promoting competitive behavior in deliberate decision making (Sheese and Graziano, 2005). More specifically, participants to the violent condition were significantly more likely to choose to exploit their partners compared to those of the non-violent condition. Moreover, they were more convinced that their partners would exploit or distrust them. Instead, participants in both conditions generally expected that their partners would trust them and cooperate with them. However, participants in the violent condition were more likely to exploit than trust and choose to defect compared to those in the non-violent condition. These findings suggest that playing violent VGs may undermine prosocial motivation and promote exploitive behavior in social interactions.

Recent studies examined the influence of VG on self-perception, a process termed *identity simulation* (Fischer et al., 2010; Hull et al., 2012). In these studies, it was investigated how adoption of moral frameworks through identity simulation can impact on subsequent behaviors. By means of the *identity simulation*, players embrace the characters' decisions and behaviors as their own and a game player can adopt the traits' and attitudes of the controlled character, and this happens also outside virtual reality (Kaufman et al., 2012). Thus, moral decisions made while videogaming, could influence players' views of themselves and their morality, and this self-perception could impact real moral behaviors. The study of Ellithorpe and coworkers (2015), examined how people make and interpret moral behaviors in VGs, and how gaming behaviors influence real-world behavior. Participants made a moral decision in a VG, followed by two behavioral tasks. They were instructed to take on a deontological (save as many lives as possible) or utilitarian (win against the enemy, at any cost) mind-set during gameplay. The game asked participants to choose between saving one person or allowing him to suffer for the greater good, in this case, aiding the war ef-

fort. Immediately after, they played a game with another participant (actually a computer, in a task called Noise Blast; Bartholow et al., 2006; Bushman, 1995): whoever was faster would be rewarded with money, whoever was slower would hear an uncomfortable blast of noise. Participants set the noise and reward levels for their “partner,” and their “partner” set levels for them. In the post-test participants indicated the decision they perceived as more moral. Results showed that players tended to see the deontological option as the more “moral”. More specifically, participants who had implemented the deontological choice in the game may have felt more strongly that they had the moral high ground, so they were more likely to retaliate against another participant who had blasted them with noise by reducing the reward the other participant received. On the other hand, participants who had implemented the utilitarian choice shifted their view of this behavior to be slightly more moral, these participants were less likely to retaliate by reducing reward levels. Although it is believed that participants internalized the moral mind-set from the game, participants may have felt the need to justify their in game actions. Importantly, either explanation involves the character’s behavior being internalized, and the participant acting in a manner that is consistent with moral license.

These results indicate that people may see identity simulation through moral behavior in video games as a sufficient way to fulfill their moral quota (Ellithorpe et al., 2015). If mediated behavior acts as a sufficient substitute for actual behavior, then moral license processes may occur more frequently than previously expected. Thus, the adoption of different mind-sets can impact players’ real-world behavior. These changes provide evidence for moral license (Mikhail, 2007) as a theoretically important perspective in VG and moral behavior research, with identity simulation as one possible mechanism (Fischer et al., 2010; Hull et al., 2012). The effects of violent VG with simulation of moral behaviors is therefore not cut-and-dried, but instead a complex process the

outcomes of which depend on gameplay experiences and perceptions.

2. Pathological Gaming and Decision Making

Pathological gaming in adolescents and young adults is an emerging problem in developed societies, being a direct consequence of the rapid escalation of technological advances.

Some studies have shown that pathological gaming might overlap other behavioural and substance addictions. In fact, in healthy volunteers playing to VGs is usually associated with greater ventral striatal presynaptic dopamine release, suggesting that videogaming is potentially rewarding or motivating in itself (Koepp et al., 1998). Adolescents that can be described as frequent VGs players present greater volume in left striatal grey matter, a region that also had greater activity during loss feedback and that negatively correlate with deliberation time at the Cambridge Gamble Task (Kuhn et al., 2011). Following a 6 week extended gaming exposure of healthy volunteers, an increased orbitofrontal and anterior cingulate activity has been observed, suggesting that VGs playing can act as a reinforce and associated cues can become conditioned reinforcers (Han et al., 2010). Similarly, subjects with pathological gaming have a greater cognitive bias and cue reactivity towards game-related images, with greater medial prefrontal and anterior cingulated cortex activity (van Holst et al., 2012; Zhou et al., 2012; Lorenz et al., 2013). Pathological gaming is also associated with greater impulsivity on the Barratt’s Impulsiveness Scale and greater perseveration on the Wisconsin Card Sorting Test along with increased volume in thalamus and inferior temporal and occipital gyrus (Han et al., 2012). Moreover, pathological gamers further demonstrated an impaired motor response inhibition as assessed by Go/No Go tasks, along with decreased error-related negativity (Littel et al., 2012). These results reveal that some mechanisms of behavioral and substances addiction are common to both addiction and gambling.

Another feature that we can observe in both substance/behavioural addictions and game dependence is the impulsivity, that can be differentiated into decision and motor impulsivity (Robbins et al., 2012; Perry and Carrol, 2008). Decision impulsivity includes impulsive choice (a preference for an immediate smaller reward over a larger delayed reward; Kirby et al., 1999) and reflection impulsivity (the tendency to gather and appraise information prior to making a decision; Clark et al., 2006). Motor impulsivity includes motor response inhibition (Aron et al., 2003) and premature responding, or also anticipatory responding (Voon et al., 2013).

On the basis of these evidences, Irvine and colleagues (2013) investigated the different subtypes of decisional and motor impulsivity in a well-defined pathological gaming cohort, hypothesizing that VGs would be associated with greater decision impulsivity, both in terms of delay discounting and reflection impulsivity (Irvine et al., 2013). Results showed that pathological gaming is actually associated with greater decision impulsivity, with less evidence sampled prior to a decision and greater impulsive choice. Increased reflection impulsivity (e.g. sampling less evidence or opening fewer boxes prior to making a decision) had negative consequences with pathological gamers obtaining significantly fewer points, possibly mediated via the numeric increase in number of sampling errors (Irvine et al., 2013). From these results, it could be concluded that pathological gamers might be less sensitive to the introduction of cost or penalties or may be more impaired in the integration of decision cost in optimizing final outcomes; this suggests that pathological gamers may be more likely to respond to instrumental reward feedback and less to negative costs in decision making (Irvine et al., 2013).

Also, according to some researchers, pathological gambling players might suffer from more discrete cognitive biases of probability estimation and choices that are not specific to pathological gambling, but are exacerbated by the disorder. In fact, cognitive biases influence decision-making,

resulting in an increased risk willingness when winning probabilities are seen as high, and in risk aversion when winning probabilities are seen as low. Goodie (2003, 2005) and Lakey and co-workers (2006, 2007) observed that pathological gamblers were more confident in their decisions about a general knowledge task, even though they had no greater competence or performance level than non-gambling controls. Problem and pathological gamblers were also more likely to accept lower probability gambles, which suggests a higher degree of cognitive bias.

However it would appear that the condition is not created in experienced poker players which have a significantly lower bias in estimating the winning probability of hands and played hands with a significantly higher average winning probability compared with inexperienced players (Linnet et al. 2010). Linnet and colleagues (2012) reported that pathological gambling poker players had a larger error margin of probability estimation, played hands with lower winning probability, and had poorer differentiation of winning probability between played and folded hands compared to experienced poker players. Pathological gambling poker players and inexperienced poker players did not differ on these measures. These results suggest that cognitive biases in pathological gambling poker players cannot simply be explained as a problem of decision-making, that pathological gambling poker players have intact probability estimation, but are drawn toward risky gambles (Linnet et al., 2012).

FUTURE RESEARCH DIRECTION

On the basis of this brief analysis of the limited existing literature, we could say that the exposure to VGs may results in changes of individuals' decision making.

The results reported and discussed in this chapter necessarily require further investigation, studying these topics in more detail and with greater and balanced sample.

A well known limit, indeed, is related to the fact that almost all investigation have been carried out on men. Moreover, it would also be appropriate to conduct longitudinal studies, in order to verify if the observed results can be intended as permanent or if they are only acute and limited in time. Furthermore, this field of research would strongly gain from new investigations aimed at clarifying whether decision making is equally influenced in pathological gamblers and “healthy” VGs players. Also, additional research should be oriented on possible differential effects of different genres of VGs on decision making: it is, in fact, arguable that action and non-action VGs might differentially affect cognitive processes, an interesting issue not still directly tested. As a possible improvement, also differential effects between different kinds of games (strategy, sport, life simulation, etc) merit to be investigated.

In conclusion, this brief review underlines the relevance of new research to better understand how VGs in general and gambling in particular can influence decision making and for clarifying the mechanisms underlying such changes.

CONCLUSION

The study of the VGs exposure on decision making is a new field of research, currently characterized by few investigations. With this mini-review, we aimed at providing different considerations about the role of VGs on this higher order cognitive process.

Video games seem to influence impulsive decisions, both in subject with pathological gambling (Bailey et al., 2013) and healthy sample (Irvine et al., 2013). Experienced or pathological players tend to decide more impulsively, prefer smaller and immediate rewards and spend less time to analyze elements available before making a choice. Gamblers showed a lower sensitivity to negative reward or punishment (Bailey et al., 2013) that should discourage these behaviors.

Bailey and colleagues (2013) were the first to make a distinction between FPS and strategic video games, showing that strategic video game players are led likely to take risky decision and are more susceptible to negative feedback compared FPS players. These results, together with other studies (Fischer et al., 2009; Beullens et al., 2011) have highlighted the need to begin to distinguish various types of video games and focus on different effects that they can induce.

Several studies have shown that VGs have an important role in the moral decision, in particular the work by Ellithorpe and colleagues (2013) showed that players can identify themselves with the character's choices who plays in the VGs and that this choice influence the subject' behaviour out of the virtual world as a result of moral license (Merritt et al., 2010; Monin e Miller; 2001). This is an important result because prove that decisions taken in virtual context can modify the choice that we will take in the everyday life, well outside the game.

Finally, regarding the influence of violent VGs on competitive or cooperative behavior it has been seen that violent content can evoke the same type of behaviour towards a partner and lead to the decision to compete instead cooperate though without affecting the trust and the relationship that the subject puts in partner (Sheese e Graziano, 2005).

KEY TERMS AND DEFINITIONS

Adolescence: The transitional period between puberty and adulthood in human development, terminating legally when the age of majority is reached.

Behavior: The actions by which an organism interacts with surrounding environment.

Cognition: The mental process of knowing, including several aspects as, for example, awareness, perception, reasoning, memory and judgment.

Decision-Making: The thought process of selecting a logical choice from the available options.

Executive Control: A set of cognitive processes (as attentional control, or working memory) that are necessary for the cognitive control of behavior.

Gambling: Recreational activity that consist in gamble or bet money on the outcome of a game. Gambling can became an addictive habit.

Pathological Gambling: Persistent and recurrent problematic gambling behavior leading to clinically significant impairment or distress, as indicated by the individual itself or by friends and relatives.

Video Game: Electronic device that allows to interact with the projected images on an screen. This apparatus allows to simulate real or unreal situations, on which the players intervenes using a keyboard or a joystick.

Learning With Games and Digital Stories in Visual Programming

Wilfred W. F. Lau

The Chinese University of Hong Kong, China

INTRODUCTION

This paper traces the recent development and the use of games and digital stories for engaging students in learning in visual programming environments (Lau & Yuen, 2015).

Games have long been used to arouse and sustain students' learning interest. Wu and Wang (2012) contended that as students modify or develop a game by using a game development framework (GDF), they can learn different skills and concepts in computer science (CS) and software engineering (SE). They labeled this learning experience as game development-based learning (GDBL), and showed that it consisted of "four elements (course aim, pedagogical theory support, GDF resource pool, and impact factor), two methods (learning by creating and learning by modifying games), and six steps in the teaching process and two subjects (students and teachers)" (p. 16). More recently, Wang and Wu (2015) reviewed 66 articles related to game development and CS/SE education published between 2004 and 2012 and found that the number of articles published on this topic had increased steadily from 2004 to 2009. On average, 12 articles were published each year from 2009 to 2012. Game development was mainly used in colleges and universities (81%) but also in high schools (9%) and middle schools (9%). In CS, game development was adopted primarily to teach introductory courses and programming (77%).

Psomos and Kordaki (2012a, 2012b) advocated the practice of educational digital storytelling (EDS), which denotes the intersection of education, storytelling, and digital technology, to help

students achieve the six cognitive objectives of the revised Bloom's taxonomy (Bloom, Mesia, & Krathwohl, 1964) and acquire various literacy skills (Robin, 2006). McWilliam (2009) surveyed 300 online digital storytelling programs and found that 123 were provided by educational institutions. Of these 123 programs, 55 were hosted in K–12 schools; 42 in universities; and 26 in colleges or institutes. In schools, digital storytelling was mainly used to engage students in learning and to enhance student print and media literacy, whereas in universities and colleges, it was either embedded in student-teacher training programs or formed part of multimedia and design courses. A recent review by Gregori-Signes (2014) showed that EDS has been used extensively in different subjects and contexts at the primary, secondary, and tertiary levels as well as for teacher preparation programs.

In the following sections, I first discuss the theoretical basis and educational benefits of GDBL and EDS in general. I then present empirical evidence to support the positive effects of these two pedagogical approaches on student learning outcomes. Subsequently, I provide insights into future research directions regarding learning with games and digital stories in visual programming and then conclude the paper.

BACKGROUND

According to Dempsey, Lucassen, Haynes, and Casey (1996), computer games are rule-guided, artificial, and technologically rendered scenarios that involve one or more players and have specific

goals, constraints, payoffs, and consequences. Many people are enthusiastic about playing games and express high hopes for its positive impacts on learning. Connolly, Boyle, MacArthur, Hainey, and Boyle (2012) concluded that playing computer games, in general, was associated with numerous perceptual, cognitive, behavioral, affective, and motivational impacts and outcomes. In particular, the most prominent effects were found in knowledge acquisition/content understanding and affective and motivational outcomes. McClarty et al. (2012) identified five potential benefits of using digital games in education: 1. Games are built on sound learning principles. 2. Games provide personalized learning opportunities. 3. Games provide more engagement for learners. 4. Games teach 21st century skills. 5. Games provide an environment for authentic and relevant assessment (pp. 6–7).

Furthermore, Werner, Denner, and Campe (2014) argued that designing and programming a game can be regarded as an ill-structured design problem (Jonassen, 2000) that requires students to define the goal, decide how to reach that goal, and evaluate the solution. Because most games involve problem-solving tasks that are dynamic, time dependent, and complex, game development is often understood as a complex problem-solving process that draws on an individual's abilities to formulate complex problems, design systems, and understand human behavior (Denner, Werner, Campe, & Ortiz, 2014). Thus, it is anticipated that such a practice can help improve student problem-solving skills and higher-order thinking abilities.

Digital storytelling refers to “the art of combining narrative with digital media such as images, sound, and video to create a short story” (Dreon, Kerper, & Landis, 2011). The Center for Digital Storytelling in Berkeley, California, identified seven crucial elements of digital storytelling: point of view, a dramatic question, emotional content, the gift of your voice, the

power of the soundtrack, economy, and pacing (<http://digitalstorytelling.coe.uh.edu/page.cfm?id=27&cid=27&sublinkid=31>). Robin (2008) asserted that digital storytelling enables users to combine the traditional processes of creative story writing with various types of multimedia, which results in an electronic artifact that is accessible through both local computers and the Internet. Constructionism and the narrative paradigm are the two basic theories that support the use of digital storytelling in education (Wang & Zhan, 2010). In constructionism, students create external and sharable objects (learning by making) through active interaction and engagement in the learning process. The narrative paradigm posits that meaningful learning occurs as students attempt to interpret actions, words, and deeds from a story into something relevant to their experiences.

Digital storytelling benefits student learning in numerous ways. Using digital storytelling in the classroom helps both general education students and those with learning difficulties become more motivated to practice traditional writing. Digital storytelling can be an effective method for engaging students, from kindergarten through college, in student-centered activities mediated by technology. Digital storytelling empowers students to express themselves through multimodal communication techniques and to develop multiliteracies such as digital, global, technology, visual, and information literacy (Robin, 2008). It helps students to understand more clearly the subject matter and to improve their literacy skills.

Porter (2005) found several advantages of practicing digital storytelling: helping students to improve their multiple literacy skills, increasing their content learning, engaging students in learning across the curriculum in schools, fostering their mastery of many 21st century skills, and meeting technology standards. Digital storytelling can be integrated across a range of subject areas to enhance student learning outcomes. Curriculum

integration enables students to establish connections across content areas and to communicate their experiences to a wider audience.

EMPIRICAL EVALUATION

Hwang, Hung, and Chen (2014) found that a peer assessment-based game development approach enhanced students' learning achievement, learning motivation, problem-solving skills, and their perceptions of the use of educational computer games compared with those who were instructed with a conventional game development approach. The peer assessment-based approach also helped students engage in deep learning. Akcaoglu and Koehler (2014) showed that students attending the Game-Design and Learning program outperformed their counterparts who did not attend the program in several problem-solving tasks including system analysis and design, decision making, and troubleshooting. This provides empirical evidence that the program can improve student problem-solving abilities. In their review, Wang and Wu (2015) also reported the positive effects of using game development to improve student motivation and engagement.

However, Chu and Hung (2015) indicated that although the game-based development approach was effective in promoting student problem-solving skills, students learning with this approach showed no difference in academic achievement or motivation from others who learned by playing a digital game. This calls for further research to determine the contextual factors that influence the success and effectiveness of this learning approach.

Burke and Kafai (2012) demonstrated the efficacy of a 7-week writing workshop in helping students to learn the basics of both programming and storytelling, which was reflected in the digital stories they produced (products), the debugging and revising they performed (processes), and their overall perceptions of the workshop at its end. Students also realized that programming and

writing were interrelated composition processes. Fields, Kafai, Strommer, Wolf, and Seiner (2014) explored the effects of collaborative and interactive storytelling activities in a Scratch online community on youth learning of computer programming in two aspects: (1) how this learning experience supports creative expression in collaborative digital stories in both media and code; and (2) how feedback from commentators influences the artistic and computational qualities of stories undergoing revision. They found that the participants could make story designs that were more creative and develop code that was more sophisticated for their final submission after receiving constructive feedback from the Scratch online community.

FUTURE RESEARCH DIRECTIONS

It is believed that GDBL and EDS will remain frequently used approaches through which students learn computer programming in visual environments. Future research may continue to investigate how computational thinking (CT) is developed in visual programming languages. According to Brennan and Resnick (2012), CT involves problem solving by using CS concepts and entails three key dimensions: computational concepts, computational practices, and computational perspectives. Some empirical evidence suggests that visual programming helps increase K–12 student performance in the three dimensions of CT (Lye & Koh, 2014). In addition, Chang (2014) showed the effectiveness of using Alice and Scratch in corrective instruction, raising university students' playfulness and enjoyment levels, and improving their learning performance.

Another research direction concerns the viability of using visual programming to enhance CT, which may promote science, technology, engineering, and mathematics (STEM) learning among K–12 students. CT has been identified as the core component in all STEM disciplines (Grover & Pea, 2013) and there has been an ongoing effort to integrate CT into STEM curricula. For

example, Weintrop et al. (2014) proposed a CT-STEM skills taxonomy framework that consists of four major categories of relevant skills: data and information skills, modeling and simulation skills, computational problem-solving skills, and systems thinking skills. However, little is known about how CT can be taught in STEM subjects in practice and, more important, whether and how visual programming may affect STEM learning through the development of CT. Additional studies exploring these issues are necessary.

CONCLUSION

This paper reports on recent development of using GDBL and EDS to engage students in learning in visual programming environments. The empirical findings support the positive effects of these two learning approaches on a range of student learning outcomes. Because many available visual programming tools are free of charge and provide a low-floor, high-ceiling learning environment, teachers should encourage students to venture into the programming world with these tools. Such practice is beneficial to student learning both within the CS discipline and across disciplines. In particular, more research should be devoted to investigating how visual programming may enhance student CT and STEM learning.

KEY TERMS AND DEFINITIONS

Visual Programming Environments: They are computer software that support the use of visual expressions such as graphics, drawings, animations, and icons in the programming process.

Game Development Framework: It encompasses the toolkits used to develop or modify games such as the game engine, game editors,

simulation platforms, or any integrated development environment.

Game Development-Based Learning: This learning approach requires students to modify or develop a game on the basis of a game development framework. Students are expected to acquire different computer science and software engineering skills and concepts in the learning process.

Digital Storytelling: It refers to the combination of a narrative with multimedia elements such as text, images, sound, and video for creating a short story.

Educational Digital Storytelling: A blend of education with digital storytelling, educational digital storytelling aims to help students to attain the six cognitive objectives of the revised Bloom's taxonomy and develop various literacy skills.

Computational Thinking: It involves solving problems by employing concepts fundamental to computer science.

Science, Technology, Engineering, and Mathematics: It is increasingly important for any government to improve STEM education in order to maintain its competitiveness in science and technology development.

The Process Model of Gameplay to Understand Digital Gaming Outcomes

Linda K. Kaye
Edge Hill University, UK

INTRODUCTION

Digital games have been the focus of psychological research for a number of decades, yet there remains substantial concern and debate about the potentially harmful effects of violent digital games on children and young people (DeLisi, Vaughn, Gentile, Anderson & Shook, 2013). These concerns primarily relate to the amount of violent content in particular types of digital games, given that evidence has suggested exposure to violent content in games is related to increases in aggressive attitudes and behaviour (Anderson et al., 2010), and reduced sensitivity to real life violence (Bartholow, Bushman, & Sestir, 2006).

While some researchers claim that there is conclusive evidence of a link between violent game exposure and aggressive cognition, affect and behaviour (Anderson et al., 2010), others have criticised the theoretical and methodological basis of such claims (Adachi & Willoughby, 2011a; Elson & Ferguson, 2014; Ferguson, 2007). This suggests a need to reconsider the way in which outcomes of (violent) gaming are studied. This is the key focus of the current chapter. This includes a critical consideration of the socio-cognitive models which are typically used within this area, and questions the extent to which they can effectively represent the range of potential outcomes of playing digital games. Following this, other key factors are reviewed, and presented as a reason to reconsider the theoretical underpinnings of this research field. Here, a Process Model of Gameplay is presented as a solution to further understand these issues. Specifically, this model

aims to provide a framework through which to understand a variety of factors and the diversity of gaming experiences, and their combined role on gaming outcomes. In a practical sense, this can inform future psychological research to adopt a more holistic approach when measuring digital gaming outcomes, particularly in controlling for the extent of factors which are influential in this regard.

Background: Existing Theoretical Models

Existing theoretical models explaining the influence of violent game content on aggression outcomes include the General Aggression Model (GAM: Anderson & Bushman, 2002; Anderson & Huesmann, 2003), and the General Learning Model (GLM: Buckley & Anderson, 2006). These consolidate existing socio-cognitive models to explain the effects of media violence on aggression-related outcomes. The underlying principle of these models is that engaging with violent digital games interacts with an individual's internal state, trait and situational factors to influence appraisal and subsequent behaviour (DeWall & Anderson, 2011). The long-term effects of such processes are said to occur through the development of knowledge structures via learning processes which create a repeated pattern of responses, increasing the accessibility of violent "scripts" over time (Barlett & Anderson, 2013). Beyond this, the GLM more specifically explains how exposure to *any* media content can "teach" a behavioural response. This includes the role of prosocial media content

on teaching prosocial behaviours (Greitemeyer & Osswald, 2009), suggesting digital games can be effective “teachers” when exposing participants to specific types of content (Gentile & Gentile, 2008), and thus highlighting their use within educational contexts (Prensky, 2001). However, given that many games include violent content, this has caused substantial concern in particular academic communities, and prompted much research to investigate the way in which repeated exposure to game violence may be harmful through the way in which aggressive scripts are learnt and applied in the real world.

Although some studies have provided support for these models, other studies have not. Specifically, some researchers have criticised the restrictive nature of these models (e.g., Ferguson, 2009). One such criticism is that they imply “passive modelling” in which individuals exposed to violent media will be more likely to engage in real world violent behaviour, regardless of other key influential factors (e.g., family violence, trait aggression) (Ferguson, 2009). Relevant evidence here is the modelling which has been shown through objectification of females within many digital games (Burgess, Stermer & Burgess, 2007), and the consequences this has on real-world prejudices and beliefs towards women (Beck, Boys, Rose & Beck, 2012; Dill & Thrill, 2007). Similarly, particularly in relation to aggressive effects, existing models exclude the role of genetic predispositions and innate motivational systems towards violent behaviour which are believed to explain a substantial proportion of the variance in real-life violent behaviour (Eley, Lichtenstein, & Moffitt, 2003; Ferguson, Rueda, Cruz, Ferguson, Ritz, & Smith, 2008). Thus, greater specificity is needed within theory on how such factors function in this process (Ferguson & Dyck, 2012).

Additionally, existing models are not entirely clear in their capacity to test the influence of a range of other factors which have also been suggested to interact upon gaming outcomes (Krahé & Möller, 2004; Markey & Scherer, 2009). For example, emotional regulation has been found as a

mediator of the of violent gaming—aggression link (Unsworth, Devilly, & Ward, 2007). This suggests that gaming may serve a mood management function for some individuals (Unsworth et al., 2007). Indeed, mood management theory (Zillman, 1988) suggests that players may be motivated to play as a means of maximising exposure to positive stimuli, as a way of enhancing mood (Bowman & Tamborini, 2015). Conversely, this can result in games being successful in alleviating negative states (Ferguson & Rueda, 2010). This suggests a positive function of (violent) gameplay which existing theoretical models are unable to address. Understanding gaming processes are therefore key, highlighting the importance of understanding *changes* in experiences through gaming in order to fully examine the influence of gameplay processes on the outcomes of the activity. In response to this, the Process Model of Gameplay is presented (see Figure 1). This acknowledges the influence of the dynamic and varied nature of gaming processes upon the range of outcomes of the activity.

Future Research Directions: The Process Model

The Process Model can provide a basis through which to underpin research which aims to explore the various outcomes of gaming, particularly in how the factors identified here are influential in this regard. The merit of this model is that it highlights the range of factors and potential interactions which underpin the dynamic and varied nature of gaming experiences. This can therefore provide a basis from which to research a variety of different mechanisms which underpin gaming outcomes. The following sections identify key themes which are integrated within this process-based model to understanding digital gaming outcomes.

Type of Games and Platforms

In addition to individual factors (e.g., traits, emotional regulation) previously outlined, potential

Figure 1.

variations in gaming experiences may also depend on factors such as game genre and platform (Limpingos, Schmierbach, Kegerise & Dardis, 2011). For example, previous studies have identified reduced physiological and emotional responses when playing games on handheld compared to TV-based consoles (Ivory & Magee, 2009). Additionally, enhanced responses to violent content has been found when playing on immersive games technology compared to traditional platforms (Persky & Blascovich, 2007, 2008). This suggests that different gaming consoles have a role in determining the outcomes of the activity. Different game genres have also been found to have differential physiological effects, with greater arousal being identified when playing driving games compared to first-person shooter games (Goodson & Pearson, 2009). This suggests the importance of integrating these factors into models of gaming outcomes. Games are structurally complex, and consist of a range of different dimensions (Bryce & Kaye, 2011). Indeed, previous research shows how specific game dimensions (e.g., identification with game characters, pace of action) are influential upon the derived experiences of the activity (Elson, Breuer, Van Looy, Kneer, & Quandt, 2015). Therefore, understanding the complexities of

digital games and acknowledging this within the theoretical underpinnings of digital game research is a key requirement. Unfortunately, theories such as GAM or GLM fail to account for the way in which variables and experiential factors may be influential in the way in which individuals respond to games, and how these may vary as a result of the interaction of the individual and the games technology (Nacke et al., 2009). In light of this, the Process Model includes these as factors underpinning digital gaming outcomes. Here, “game platform” and “type of game” are two identified sub-factors included within the model, in an attempt to provide a more interactionist perspective for modelling gaming outcomes.

Knowledge and Engagement

Another issue with previous models is the lack of acknowledgement of the knowledge of players, and their experiences associated with moral engagement with virtual violence. Specifically in relation to player knowledge, evidence shows differences between players and non-players in cognitive defence mechanism responses to shooter games (Kneer, Munko, Glock & Bente, 2012). Additionally, other research demonstrates differences

between individuals in their gaming experiences (Cotton, Mayes, Jentsch & Sims, 2001; Cox, Cairns, Shah & Carroll, 2012), and responses to priming of aggression-related concepts (Glock & Kneer, 2009). In respect of moral engagement in violence, research shows these individual differences to be influential to the emotional responses associated with gameplay (Young & Whitty, 2010, 2011). The ability of some games to offer opportunities for players to engage in violent acts and violate real-world social norms in the virtual world can provide intense positive emotional experiences (Bertozzi, 2008; Hartmann & Vorderer, 2010), suggesting that the consequences of violent gameplay are not necessarily solely and exclusively negative in nature. In light of this, the Process Model acknowledges “player traits” in respect of the individual variations in responses to specific game content, and how these hold a combined influence on the nature of gaming outcomes. In this way, the Process Model can provide a more holistic perspective of gaming outcomes, in respect of player experience—game context interactions, which previous models fail to include.

Contextual Factors

A further key limitation of existing theoretical models is their inability to account for the variety of social contexts in which games are experienced. That is, existing models do not account for differences in experiences between immediate gaming contexts in which gamers may be playing alone, compared to with others, and whether or not this in the physical presence of others or via online gameplay. Evidence suggests that different social contexts of gameplay result in differential experiences (de Kort, IJsselsteijn, Poels, 2007). For example, social opportunities with others can enhance emotional gaming experiences (Kaye & Bryce, 2012), and result in enhanced positive mood following gameplay (Kaye & Bryce, 2014). Other research has compared levels of arousal, engagement and mood between different gameplay contexts and found that outcomes are more strongly enhanced in the physical presence of others during

gameplay relative to virtual presence (Gajadhar, de Kort & IJsselsteijn, 2009). Similarly, different types of gameplay (i.e., competitive versus cooperative play) do not hold equivalent outcomes (Lim & Lee, 2009), resulting in limitations of existing models which cannot account for these distinctions. The importance of acknowledging social contexts of gaming is particularly pertinent given the increasing popularity of social gaming (Information Solutions Group, 2011). It makes conceptual sense therefore to integrate these constructs into frameworks designed to theorise on gaming impacts.

As well as immediate gameplay contexts, there are wider socio-cultural contexts of interest here. That is, values of social systems may be largely determined by cultural conception and transformation of social representations (Moscovici, 2000). Social representation of identity (e.g., gamer identity) for example is one factor which has been found to be related to different psychological outcomes of digital gaming (Kaye, 2015), suggesting these wider social contexts and constructs play a role in this process. Similarly, when considering gaming within the context of gamers’ everyday lives, it is possible to see how it operates as a part of gamers’ social identity formation (Kaye, 2014). This highlights the importance of understanding these socio-contextual influences on gaming outcomes. Thus, the Process Model addresses the limitations of existing theoretical gaming models by acknowledging gaming context (in respect of immediate and wider socio-cultural context) within this framework. Specifically, this framework models the player—game experience interaction through a contextual lens, given that the outcomes associated with these interactions are expected to vary considerably as a result of contextual variations.

A Leisure Framework

The fact that gaming is a highly popular leisure activity suggests that it facilitates a range of positive experiences and outcomes for players. Most people engage in leisure to experience enjoyment

and freedom from everyday life (Harper, 1986). Specifically in relation to gaming, the derived enjoyment is a key intrinsic motivation for continued engagement (Ryan, Rigby & Przybylski, 2006), in similar ways to that of other leisure (Harper, 1986). That is, gaming provides opportunities for psychological need satisfaction, through enhancing perceptions of efficacy, skill growth and relatedness with others (Przybylski, Deci, Rigby & Ryan, 2014; Reinecke, Klatt & Kramer, 2011; Ryan & Deci, 2000).

A leisure perspective presents a useful approach through which to examine the motivational and experiential processes associated with gaming. In turn, this explains the potential psychological benefits, including; enhanced well-being (Ryan et al., 2006), positive mood (Hull, 1990), and recovery (Collins & Cox, 2014; Reinecke, 2009). Therefore, when viewing gaming through the lens of enjoyable leisure, it should hold similar benefits as other leisure activities, highlighting the utility of this framework for theorising on the more positive outcomes of gaming. Specifically, this perspective assumes a broader role of the activity itself; a key feature underpinning the Process Model presented here. That is, it can provide a way of examining the *processes* involved in gameplay, to better understand how these experiences operate for promoting a range of (positive) gaming outcomes. This extends the focus from solely concerning the content of games, and instead suggests them to operate in equivalent ways to that of other leisure. This can extend beyond the realms of immediate and short-term effects, and can offer insight into the more enduring, broader outcomes of this activity (Mayra, 2007).

An operational example of the Process Model relates to flow theory (Csikszentmihalyi, 1975). This theory proposes that individuals experience enjoyment during an intrinsically motivated activity, characterised by total concentration and lack of self-awareness (Csikszentmihalyi, 1975). Flow, in the context of gaming can provide an insight into motivations for participation, the associated positive experiences, and their combined influ-

ence on the nature of gaming outcomes. This is supported by research highlighting the importance of understanding player experiences, particularly in relation to the goal-directed nature of play, and how this might provide a more useful framework than a focus on game content, as in previous models (Oswald, Prorock & Murphy, 2014). As outlined in the Process Model, enjoyable and intrinsically motivated gaming experiences, are likely to largely result in positive emotional outcomes.

Considering gaming as enjoyable leisure provides a useful framework through which to examine the impact of experiential aspects of the activity, which may better account for a more diverse range of outcomes. Specifically in relation to flow for example, the Process Model can underpin its function in explaining continued motivation for specific types of games, highlighting the way in which gaming motivations and experiences are best understood in combination, as an effective way of predicting gaming outcomes. Therefore, the possibilities of future research avenues are fruitful, particularly in relation to examining the impacts which occur as a result of the *processes* of gameplay. On a practical level, research findings within this perspective can offer game industry representatives better scope for applying these approaches to player testing protocols, and indeed an informed evidence-base through which to effectively market their games in light of positive player experiences.

Although existing theory has largely focused on the role of violent game content on aggression-related outcomes, this represents only a small part of the overall gaming experience. Games are complex, providing diverse and variable experiences, indicating the utility of the Process Model in better capturing the dynamic and idiosyncratic nature of the player—game interaction. It is intended that the Process Model may initiate a research agenda which acknowledges the complexities of digital games, and the processes afforded to the activity itself, in order to expand beyond the “negative effects perspective”.

CONCLUSION

This chapter has provided a critical review of the theoretical underpinnings of digital gaming research. It has highlighted the limitations, and presented the Process Model of Gameplay as a more holistic framework for these issues. Specifically, this model presents a dynamic process framework for better examining digital gaming outcomes, through a more comprehensive interactionalist account of the relevant factors. In this way, this model may serve as a vehicle for modeling further research approaches. Although initial support is available for the range of influences included within the Process Model of Gameplay, future research is required which examines the validity and efficacy of the proposed framework. In particular, additional work which accounts for the dynamic process of gaming and how this impacts upon diverse gaming outcomes is greatly warranted. Such a focus would entail a move towards methods such as Experience Sampling Methodology, to gain players' accounts of their "real-world" gaming experiences (Kaye, Monk & Hamlin, in press). Indeed, this calls for research in this area to shift from the traditional "global, broad" perspective, towards a more idiographic one, if a more comprehensive understanding of the range and diversity of outcomes is to be established. This would provide a valuable contribution to the theoretical underpinnings for explaining how and why different individuals respond differently to particular digital games.

Overall, this chapter has argued for a greater focus on understanding the dynamics of gameplay as the direction for future research in this area, and presented a Process Model in response to this. Although a large body of research has examined the influence of violent game content on aggression-related outcomes, this constitutes only one aspect of the overall digital gaming experience. Understanding the complexity of digital games, gaming process and associated outcomes

can only be achieved by adopting a more holistic approach to the study of the activity. In this way, it is hoped that the Process Model of Gameplay may be a suitable starting point, through which to initiate this research agenda.

KEY TERMS AND DEFINITIONS

Digital Games: Used here as a generic term to include all electronic games which can be played in arcades, on game consoles, hand-held consoles, PCs, and over the Internet.

Emotional Regulation: One's ability to utilise emotional stability.

Genetic Predisposition: The extent to which an individual is biologically determined to think or behave in a certain way.

Intrinsic Motivation: Undertaking a task or activity for an internal or inherent sense of reward rather than an external reward (e.g., money).

Social Identity: The extent to which an individual defines themselves by their affiliation to a social group (e.g., gamer).

Serious Games Advancing the Technology of Engaging Information

Peter A. Smith

University of Central Florida, USA

INTRODUCTION

The term Serious Games is an umbrella term that refers to any games that have goals other than pure entertainment. The term grew in popularity in the early 2000s when the Foresight and Governance Project at the Woodrow Wilson International Center for Scholars founded the Serious Games Initiative (SGI). The SGI was founded to pursue the goal of helping to organize and accelerate the adoption of computer games for non-entertainment purposes. This included exploring new applications for games in education, training, recruitment, and beyond. At this time many researchers were beginning to understand that games could have positive effects outside of pure entertainment. In Raph Koster's book, *A Theory of Fun for Game Design* (Koster, 2005) he described the motivating factor of fun in all games as the act of learning. James Paul Gee a well respected games researcher best known for his book, "What video games have to teach us about learning and literacy," focuses on the idea that all good video games exhibit thirty-six learning principles supported by literature in learning science and cognition research (Gee, 2007). While Serious Games are not based solely on the idea that games can teach, the principles behind good game design actually support learning. As a result, the research has shown that Serious Games are not just another media for learning through a passive act of absorbing material, but are a technology for engaging with information.

Games researchers are now moving from exploring if games can teach to how games teach. The caveat is that not all games teach but that all good games teach. Leaving a simple truth, it is hard to make a good game, no less a good game that is also educational. The real challenge is getting the people with the right design abilities to make these types of games and establish best practices and quantify what actually makes games as educational systems work. Efforts to move in that direction must begin with establishing terms and defining a framework for what goes into games for learning as formal systems.

BACKGROUND

Before the more modern notion of Serious Games took hold, the military made many attempts at using video games for training. The earliest being in 1980 when the Army commissioned Atari to build the Atari Bradley Trainer (P. Smith, In Press). This game was a modified version of the popular vector graphics based game *Battlezone*, also published in 1980. Only 2 Atari Bradley Trainers were ever built and shown at a trade show. It is unknown why the Army never deployed the game, but it was never actually used by soldiers.

Another military project was started by 1984, this time by the Navy, to use a video game to teach Morse Code (Driskell & Dwyer, 1984). This project also only made it through the pro-

totyping phase. The military's view of games at the time was that they were not serious enough for military training, though the problem seemed to be one of vocabulary only. This is illustrated by the Marines common use of games under the name, Tactical Decision-making Simulations (TDS) since development of the game Marine Doom in 1996 (P. Smith, 2005). Marine Doom is a modification (mod) of the popular first person shooter game Doom, and was created by the Marine Corps Modeling and Simulation Management Office (MCMSMO) developed for the training of Marine fire teams.

This prejudice against video games didn't carry over to the common practice of table top War Gaming, or the use of Flight Simulator Software on PC's, which were sold as games to the rest of the world. The military did not seem completely ready to embrace games for training until after DARPA created DARWARS Ambush, a mod to the game Operation Flashpoint, which was followed up by the Army creating TRADOC Capabilities Manager for Gaming (TCM Gaming) and deploying Virtual Battle Space 2 (VBS2) as one of many official Army Games in 2008. However this prejudice persisted after Serious Games were well established outside of the department of defense. (R. Smith, 2009)

Paralleling the emergence of games in the military is the development of the ill fated Edutainment market. In the early 1980s Edutainment games became an incredibly popular trend. These games, such as "Where in the World is Carmen Sandiego," "The Oregon Trail," "Reader Rabbit," "Math blaster," among many others flooded the market with games that contained some level of educational content. Mizuko Ito described it as a time where the developers were empowered with a "sense that they were creating possibilities for learning that freed it from the institutional constraints of schooling." (Ito, 2006).

Edutainment games succeeded in capturing an audience, and establishing itself as an accepted

part of the games industry, however, they never quite got established as a credible form of education. Ito, suggests that the reason behind this is that, "edutainment embodies the challenges which reformers face in creating new genres of representation and practice..." (Ito, 2006). However, the answer is much simpler. In general the games did not achieve the dual goals of being good educational platforms while also being good games. Edutainment, along with many of the other past attempts to develop learning games, have largely been deemed failures. A sentiment best stated by Michael Zyda, the Director of the Game Pipe Lab at USC, "The game industry has already witnessed the failure of edutainment, an awkward combination of educational software lightly sprinkled with game-like interfaces and cute dialog. This failure shows that story must come first and that research must focus on combining instruction with story creation and the game development process." (Zyda, 2005)

Clark C Apt's book, *Serious Games*, was published in 1970 and represents the first recorded use of the term Serious Games (Apt, 1970). The term Serious Games was not, however, an instant success. In the 30 years that followed, serious games had a few false starts on the road to becoming a main stream part of the non-entertainment world, the most dramatic of these being in both the education and training arenas.

Clark C. Apt defined Serious Games as games that "have an explicit and carefully thought-out educational purpose and are not intended to be played primarily for amusement" (Apt, 1970). Apt wrote these words over thirty years before the founding of the SGI but his words are still relevant and extremely close to the current definition that most game scholars adhere to for serious games. The one inconsistency of his definition is that serious games have evolved to include more applications than just education. Serious games are commonly defined as some derivation of a game designed for a primary purpose other than

pure entertainment. This definition is purposefully open ended in order to allow for the diverse backgrounds of various serious game practitioners.

Mike Zyda, the Director of GamePipe at USC, defined serious games as: “a mental contest, played with a computer in accordance with specific rules that uses entertainment to further government or corporate training, education, health, public policy, and strategic communication objectives” (Zyda, 2005). His particular definition met his vision of what a serious game could be, but others whose application of serious games do not fit into the categories defined were still searching for a definition. Further still, many industries utilize gaming technology but do not explicitly create games with the technology, yet have aligned themselves with the serious games movement.

In an effort to move towards a more open ended understanding of Serious Games, the term became an umbrella term that encompassed the efforts un-

derway, bringing all the groups working on Serious Games under one unified vision. The Taxonomy of Serious Games (Table 1.) was presented at the Serious Games Summit (SGS) held at the 2008 Game Developers Conference (GDC). It defines the current categories of games that have been developed by the Serious Games industry including, Games for Health, Advergames, Games for Training, Games for Education, Games for Science and Research, Games for Production, and Games as Work. It further cross references them with the industries that currently use Serious Games. Further slides show the amount of development in each category, illustrating that most of the work in the Serious Games Space was being done for education and training in both schools and the military. (Sawyer, Smith, P., 2008)

The success of the Taxonomy as a reference for where the market had evolved did not, unfortunately, meet the needs of everyone in the

Table 1. The Taxonomy of Serious Games

	Games for Health	Adver-Games	Games for Training	Games for Education	Games for Science Research	Production	Games as Work
Government & NGO	Public Health Education & Mass Casualty Response	Political Games	Employee Training	Inform Public	Data Collection / Planning	Strategic & Policy Planning	Public Diplomacy, Opinion Research
Defense	Rehabilitation & Wellness	Recruitment & Propaganda	Soldier/ Support Training	School House Education	Wargames / planning	War planning & weapons research	Command & Control
Healthcare	Cybertherapy / Exergaming	Public Health Policy & Social Awareness Campaigns	Training Games for Health Professionals	Games for Patient Education and Disease Management	Visualization & Epidemiology	Biotech manufacturing & design	Public Health Response Planning & Logistics
Marketing & Communication	Advertising Treatment	Advertising, marketing with games, product placement	Product Use	Product Information	Opinion Research	Machinima	Opinion Research
Education	Inform about diseases/risks	Social Issue Games	Train teachers / Train workforce skills	Learning	Computer Science & Recruitment	P2P Learning Constructivism Documentary?	Teaching Distance Learning
Corporate	Employee Health Information & Wellness	Customer Education & Awareness	Employee Training	Continuing Education & Certification	Advertising / visualization	Strategic Planning	Command & Control
Industry	Occupational Safety	Sales & Recruitment	Employee Training	Workforce Education	Process Optimization Simulation	Nano/Bio-tech Design	Command & Control

community. Debate on the appropriate categories continues. While criticisms can be made of final categorization, the model persisted and it is commonly understood that Serious Games cannot be defined as a single type of game or a particular field.

UNDERSTANDING SERIOUS GAMES THROUGH UNDERSTANDING GAMES

Despite the strides Serious Games have taken in recent years they are considered subpar as games by many due to the lack of an established design methodology, general development guidelines, and underprepared designers. Jacob Habgood of The University of Nottingham's Learning Science Research Institute labeled them to be "Chocolate-Covered Broccoli" due to their poor marriage of games and learning (Habgood, 2005). His suggestion to solve this is a tighter integration between game mechanics and the learning content or what he terms as Intrinsic Integration (Habgood, Ainsworth, & Benford, 2005). This is a sentiment shared by NavAir's Dr. Robert Hays in his game based research literature review (Hays, 2005).

Both Habgood and Hays understood that for good learning outcomes to occur gaming characteristics or features needed to support instructional objectives completely. This of course means that learning games need to go beyond the "lightly sprinkled... game-like interfaces and cute dialog" Zyda (2005) used as a charge against edutainment. They need game mechanics that support both gameplay and learning at the same time. Game mechanics are, "mechanisms through which players make meaningful choices and arrive at a meaningful play experience" (Salen & Zimmerman, 2004). In a book written by Adams and Dormans (2012), mechanics are referred to as feedback loops and some are specifically used to design the internal economy of games to make them challenging. These economies are a basic

exchange of resources between player and system and can create deadlocks and mutual dependencies.

In order to map these mechanics to learning outcomes it is important to understand what features of games support what types of mechanics. Further in order to insure those games support learning it is important to have an understanding of what features of games support what learning outcomes. By mapping these features against each other, an understanding of how game mechanics map to learning outcomes can be gained.

Features of Entertainment Games

Before being able to determine the features of games that lead to better learning, it is important to first identify the features that fundamentally define a game. Unfortunately, there isn't one agreed upon definition that everyone in the game industry uses. Further, the definitions that are used seem to vary widely.

Many definitions are far too simple to describe all games well. One of the most oft mentioned definitions is Sid Meier's declaration that, "A game is a series of interesting decisions." (Bateman, 2008). While this might be true of good strategy games, the type of games Meier is known for, this does not include simple twitch or rhythm games, where the player is tasked with maintaining good timing but is limited by the decisions they can make. The definition cited by Jane McGonigal, a well-known proponent of gamification, in her book, *Reality is Broken*, is one by the philosopher Bernard Suits. He stated, "Playing a game is the voluntary attempt to overcome unnecessary obstacles," (McGonigal, 2011; Suits, 1978). This definition, while open ended enough to justify gamification as a legitimate type of game, does not provide enough details to even meet the features McGonigal suggests in her book, which include: goals, rules, feedback, and voluntary participation (McGonigal, 2011). Though this set of features is already flawed as many educational games are compulsory to courses.

The game designer whose games are most often cited when the question of what makes a game versus a simulation is Will Wright. His games include *SimCity*, *The Sims*, and *Spore*, but he doesn't consider them games; he describes them as toys. "People call me a game designer, but I really like to think of these things more as toys," (Wright, 2007).

One of the earliest game scholars, Johan Huizinga, defined games in his book, *Homo Ludinus*, as "...a free activity standing quite consciously outside ordinary life as being not serious, but at the same time absorbing the player intensely and utterly... according to fixed rules and in an orderly manner," (Huizinga, 1949). Jesper Juul provided a definition that attempted to encompass the various views one could take on games. In doing so, he categorized definition in the categories of: the game as a formal system, the player and the game, the game and the rest of the world, and other (Juul, 2003).

A good definition for those interested in Serious Games would consider a game as a formal system that can be applied to learning. As such, the definition of games used moving forward here will be Katie Salen and Eric Zimmerman's definition provided in their book *Rules of Play*. Salen and Zimmerman, like many other game researchers, developed their definition through a thorough analysis of various definitions. In particular, they used a total of eight leading definitions that were suitably feature rich. Three of these definitions have already been discussed; all of them are by leading games researchers or designers themselves. By carefully comparing these definitions and analyzing their meaning, they settled upon their definition and in doing so they have provided a workable framework for the features that make a game. (Salen & Zimmerman, 2004)

Using this framework as a guide, Salen and Zimmerman defined a game as: "A game is a system in which players engage in an artificial conflict, defined by rules, that results in a quantifiable outcome." (Salen & Zimmerman, 2004). Using this definition, a game can be broken up

into the following set of core features: System, Players, Conflict, Rules/Goals, Outcomes, and the Artificial.

Features of Serious Games

Learning games at their core can and should be considered games, and as games they should exhibit the same features of games that define games themselves. Therefore determining a list of features that defines learning games is a redundant process. The interesting task is in determining the features of games that support learning.

In a comprehensive review of over 41 papers performed in 2009, researchers identified over a dozen features of games that would support learning (Wilson et al., 2009). Upon closer inspection of the data provided, some features overlap with each other. Others are along considered features of games by a miniscule fraction of the 41 researchers. As seen in Figure 1, over 27 researchers found challenge to be an important feature for learning in games, while only 3 suggest location is important. For this research, only features agreed upon by 10 or more researchers will be considered agreed upon features. Further, overlapping features will be combined.

In particular, the feature of interaction, or the ability for the player to interact with the game, will be combined with control. Control is the ability for the player to maintain control of the flow of the game, an activity accomplished through interaction.

Another overarching feature of games is their aesthetic feel. This feature is represented by mystery, fantasy, representation, and sensory stimuli. The Aesthetics determine if a game provides a mystery to unravel, if the game is fantasy-based or based in realistic representation of reality, and they are responsible for the type and form of sensory stimuli provided to the player. Once repeated features are consolidated and fringe features are removed we are left with the following list: Interaction, Challenge, Rules/Goals, Assessment, and Aesthetics.

Figure 1. A Comparison of Game Features Supporting Learning

Complementary Features

The list of features that game designers have determined to define games share a remarkable level of overlap with the list of features learning games researchers determined support learning.

Interaction / Players

Interaction is a key feature of games. Games are to be played by players, not observed or reported on. Interaction is sometimes defined by the players themselves, “Players interact with the system of a game in order to experience the play of the game” (Salen & Zimmerman, 2004). Other times it is defined through the type of hardware, such as a game controller, or mouse and keyboard combinations. Interaction can occur in many ways, and through many mechanisms. The interaction and control of a game is often dependent on the core game mechanic of physics where it is “used to test the player’s dexterity, timing and accuracy,”

(Adams and Dormans, 2012). Thus, the most efficient controller to use would be one with the fastest and most reliable feedback between player and game objects.

Challenge / Conflict

“All games embody a contest of powers. The contest can take many forms, from cooperation to competition, from solo conflict with a game system to multiplayer social conflict. Conflict is central to games” (Salen & Zimmerman, 2004). While Salen & Zimmerman prefer to call it conflict, they have captured the essence of what this research will refer to as challenge. Challenge can be cooperative, competitive, or individualistic. It can also be a combination of any of the three. For example team versus team challenge has competition with inter team competition. Highly competitive E-sports are prime examples of how games can implement the concept of competition.

Rules/Goals / Rules

Wilson coupled the terms rules and goals into a single feature, while Salen & Zimmerman refer to only rules. “Rules provide the structure out of which play emerges, by delimiting what the player can and can-not do” (Salen & Zimmerman, 2004). They instead associate goals with outcomes. Goals in particular are difficult to separate from other features, and are possibly their own feature.

Assessment / Outcomes

“Games have a quantifiable goal or outcome. At the conclusion of a game, a player has either won, lost, or received some kind of numerical score” (Salen & Zimmerman, 2004). Games must provide feedback to the player in the form of an assessment or outcome. While the assessment might not be explicit to the player in all games, the game must provide the appropriate outcome based on the performance of the player in the game.

Aesthetics / Artificial

“Games maintain a boundary from so-called “real life” in both time and space” (Salen & Zimmerman, 2004). Games provide aesthetics to the player. This might be fantasy or reality based. It might mean a deep storyline filled with interesting plot twists or it might mean a simple song and falling blocks. While the Aesthetic is important, it can vary widely between games and can be manipulated using different gaming mediums, such as 2D vs. 3D, and Virtual Reality

Disparate Features

All five of the core features identified by learning games researchers have direct definitional overlap with features that game designers identified. The one feature game designers identified that learning games researchers did not is the concept of a system.

Salen & Zimmerman use a definition of system that is taken from Stephen W. Littlejohn, and include 4 defining elements. They are objects, attributes, internal relationships, and environment (Littlejohn & Foss, 2007; Salen & Zimmerman, 2004). Using this definition, Salen & Zimmerman further define systems as simulations (2004). The system is the core structure of a game. It determines how the environment works and what types of objects can operate within it. When other features are applied to it the game becomes fully formed. This is important when considering the game versus simulation debate. It is easy to imagine that a game is a simulation with others gaming features added to it. This, however, is not the case.

In his 2010 keynote address to the GameTech Conference, Will Wright defined his particular types of games as toys. These toys, SimCity, The Sims, Spore, among others, are commonly used to frame the argument between what is a game and what is a simulation. Will Wright further stated that his toys exist as a constraint of freeform play, and if they were constrained more they could be considered games. He did not want to constrain them with preformed goals, outcomes, or challenges (Wright, 2010). Taking a similar approach to the space of modeling and simulation one could consider a constructive simulation as a constraint of the space, but a simulation still provides a level of freeform use that makes it similar to how Will Wright refers to toys in the space of play. Simulations need a facilitator to add goals, outcomes, and challenges to the exercise. Further constraining a simulation by introducing gaming features may in fact result in a Serious Game.

FUTURE RESEARCH DIRECTIONS

Future research in Serious Games should focus on how the design of Serious Games can be used to improve learning outcomes. While research has focused on various features of Serious Games new developers have emerged that are building very

personal and informational games that combine the power of well-designed good games and a personal passion for the topic that the game covers. These games are often made for entertainment purposes and happen to be very effective serious games. These include Dys4ia, That Dragon Cancer, Tampon Run, and countless others, that cover incredibly complex and sensitive topics in new ways. The future of Serious Games may be found in the design of personal stories that explore both education and game design from much more personal view.

CONCLUSION

Current research in Serious Games has focused on exploring how the features of Serious Games effect learning outcomes. Serious Games have been found to outshine other forms of educational technology in engagement, motivation, goal orientation, and many other categories, but only when properly designed. It is important to determine if narrative can improve learning outcomes, or time on task, and this work is happening. With an understanding of how gaming features work, serious game developers can build best practices and develop even more effective and engaging games. More importantly more game designers are exploring the power of Serious Games and more great examples exist every day.

KEY TERMS AND DEFINITIONS

Edutainment: A name given to games developed during a briefly successful attempt to popularize educational games in the 80s.

Game: A game is a system in which players engage in an artificial conflict, defined by rules, that results in a quantifiable outcome” (Salen & Zimmerman, 2004).

Game Feature: An underlying component that defines what a game is.

Games For Change: Games with the primary goal of social change.

Learning Games: Games with the primary goal of education or training.

Serious Games: An umbrella term referring to any game developed for a non-entertainment based purpose.

Tactical Decision-Making Simulation: A term used by the marines to denote a Serious Game.

Towards Modelling Effective Educational Games Using Multi-Domain Framework

INTRODUCTION

The use of game-based learning (GBL) as a common medium for educational deliverance, as opposed to pure entertainment, has gained immense popularity in recent years. Main attention has recently been diverted towards the impact of gaining knowledge, engaging, and motivating learners through playing educational games (Azadegan et al., 2014; Romero, 2015). Game-based learning (GBL) is an act of appropriate game mechanics, scenario recreation, and problem oriented learning processes to ensure learning objective is accomplished (Poulsen, 2011). Designers and developers need to enhance the educational tools by integrating game domains and elements to maximize the tools' effectiveness, hence, increase learning outcomes, level of engagement and motivation. To understand the link between multiple domains and elements of GBL, there is a need to fit multiple widely known instructional approaches with experts such as game designers, developers, educators, and software engineers.

For GBL development process to be effective and reliable, it is vital to provide emphasis on involving theoretical foundations with game rules, and fun with authentic learning for lean-

ers, thus, providing an precise base for learners to gain knowledge (Hays, 2005; Kebritchi & Hirumi, 2008). The innovative learning approach derived from EG possess educational values or even different kinds of software applications that compiles into knowledgeable aspects such as teaching enhancement, assessments and evaluation of learners (Tang & Hanneghan, 2010). Nevertheless, game technologies are specifically used for accessibility of simulated and modelling environments and visualization.

Educational games are designed through a process of modelling, depending on diverse criteria such as how one element can relate to another element or types of domains used in EG. When the game developers initiate the development of EG, challenges occurs in terms of planning from gathered requirements, verifying, and cross-check to ensure several possibilities occurrence. This is due to a mixture of pedagogical, educational, and fun elements needed to be collaborated accurately. Furthermore, an effectually designed pre-model unfolding the relationships amongst game elements, and their domains is highly recommended. Therefore, a modelling technique is needed to conceptualise the elements/components in the EG and provide a holistic idea based on

how domains and their related components can be modelled to provide a promising modelling and developing process.

The objective of this chapter is to study the relationships among EG elements in order to provide game developers, software engineers, and game designers; a medium of understanding connections, interrelations, and interactions between game elements and game domains. Furthermore, they should be able to map the relationships to model out an effective educational games during developing process.

BACKGROUND

This section mainly explains how the evaluation and modelling strategies adopted or proposed in designing of EG to provide a unified modelling techniques during development process of EG.

EG Evaluation and Modelling Languages

GBL evaluation is carried out to ensure design quality (Di Loreto & Gouaïch, 2010), identify usage (Djelil, Sanchez, Albouy-Kissi, Lavest, & Albouy-Kissi, 2014), and verify instructional outcomes (Casey, Baghaei, & Nand, 2014). However, the complex nature of GBL is not well-structured (Djelil et al., 2014). Certainly, the evaluation has to undergo a definitive number of steps to measure variables and provide appropriate analysis of these variables. Although not all evaluations provide coherent results (Annetta et al., 2013; Von Wangenheim, Thiry, & Kochanski, 2009), a few existing methods for data collection and analysis have proven their efficiency and reliability in practice. Even though, the evaluation of EG is time consuming and complex; it is the only reliable aspect to verify the goals and detect malfunctions throughout the EG. Therefore, a learning game ought to be evaluated prior to being used as a learning material (Djelil et al., 2014). A recent study implements a six-phase methodol-

ogy, HEXA-GBL, for designing and evaluating GBL activities from learner centered perspective (Romero, 2015). The phases are: 1) game design activity, 2) learning objectives definition, 3) the learner-centered need analysis, and the definition of the game modalities, 4) mechanics and rules, 5) the play activity evaluation from the learning outcomes, assessment and feedback, and 6) learners' gaming and learning experience during the GBL activity. While overcoming the barriers of GBL costs and focusing on game mechanics, HEXA-GBL also prioritized the educators to operationalize with adapting processes.

Modelling processes can be a powerful 'tool' to boost student's perceptive activities, hence, refining their scientific conceptual minds (de Jong & van Joolingen, 2008). A recent and a wide range of discussion of a potential value using model-driven engineering (MDE) approaches for EG has been recorded (Dormans, 2012; France & Rumpe, 2007). Furthermore, UML-based game specifications such as Statecharts (Sauer & Engels, 2001); offer a rigorous state machine foundation, which may be difficult to use for some stakeholders (e.g., game designers). With respect to GBL, MDE can provide an environment for domain experts to produce EG via modelling without upsetting the sophistication of game development process. Moreover, it provides an increased productivity value, portability among different platforms, an easier software maintenance, reliability of mapping from model to code, and minimized modelling error (Kelly & Tolvanen, 2008).

Game designers experienced in using Storyboards prefer using tabular Use Case (UC) method (MDE) due to the similarity of presentation (Truong, Hayes, & Abowd, 2006); as it is understood, well-established, maintainable, and straightforward to define. A recent research used MDE to integrate elements of game design, pedagogical content, and software engineering methodologies to provide a storyboard with textual description of the learning objectives and game play to user interfaces. Due to iterative development process, it transforms the model into UML UC model (visual

and tabular based specifications (Stevens, 2002)), then, it converts it into formal model which can then be executable (Cooper, Nasr, & Longstreet, 2014). Although Cooper et.al, provides various modelling techniques are used in this approach, the need of a complete new solution is not evident.

In game development field, the use of software frameworks and tools are usual practice among professional (commercial) game developers. Another modelling technique, namely, Model Driven Architecture (MDA) (Miller & Mukerji, 2001), has also been implemented in Domain-Driven Software Development Framework (Agrawal, Karsai, & Lédeczi, 2003) and Modelling Turnpike (Wada, Suzuki, & Oba, 2005). These frameworks aid software architects to develop their own MDE to suit a particular domain (security, content repurposing, software testing, and pervasive computing). Although current tools improve the productivity of the development team while providing maximum control and flexibility to artistically craft the game software, the production pipeline is still very reliant on specialist artists and programmers. This therefore presents a practical solution to assist non-technical domain experts in the production of serious games.

Educational Game Design Frameworks and Models

There has been quite a number of models and frameworks proposed by researchers in developing, modelling and designing EG. Game Object Model II (GOM II) describes relationships containing various elements of EG interfaces by using Object Oriented Programming to provide a constructive way of achieving theoretical and pedagogical goals in designing EG (Amory, 2007). However, GOM II does not represent how the relationship between game elements develops over time, and its diagram can become complex and difficult to understand. Another model, Mechanics-Game Mechanics (LM-GM) model provides a graphical representation of game flow to establish relationships among components which

translates pedagogical learning mechanics into game mechanics (Arnab et al., 2015). Although it identifies abstract patterns and predefined elements to be replicated across EG, it does not expose the connection with the educational objectives to allow sustainable mechanics.

A recent model proposed with seven steps to identify attributes with specific roles and steps to each expert including cognitive and pedagogical experts, storyboard writers, artistic directors, actors, graphic designers, sound managers, etc. (Marfisi-Schottman, George, & Tarpin-Bernard, 2010). However, it is sequential based and they do not easily fit into an iterative design. Another game-based learning framework works as an evaluation tool for designers by adopting instructional and cognitive approaches in designing process to map out existing games (van Staaldunin & de Freitas, 2010). This approach is beneficial for repurposing game content and providing scalable immersive game content, however, more work is needed to assess the validating of game-design strategies such as links between components and consistency.

When model-driven approaches (MDA) are used in developing process of EG, there are benefits and challenges at all aspects (Sauer & Engels, 2001). A Model-Driven Game Development Approach (Reyno & Cubel, 2008) introduces a framework which uses the selection of UML diagrams to gather requirements into Class Diagrams which is then extended to model the relationships between different game entities and their behavior through the game actions. Another framework based on MDA (Altunbay, Metin, & Çetinkaya, 2009) uses UML Class Diagrams as the modelling language to represent the game model with the combination of languages such as Meta-model with UML Class Diagram and Domain-specific language. All the three frameworks based on MDA have similarities in terms of modelling but they differ in terms of how non-technical domain expert can deal with the modelling languages used. With regards to that concern, MDA based framework (Tang & Hanneghan, 2010) designed

to help non-technical domain experts in producing EG. Although the gap of non-technical experts is covered and the creation of game models can be represented, a challenge of having defined and explicit model while maintaining the consistency is an overlapping issue.

Another way to design EG is by providing a language using Design Patterns based on the Six Facets of Serious Game Design, namely, pedagogical objectives, domain simulations, interactions with the simulation, problems and progressions, decorum, and conditions of use (Marne, Wisdom, Huynh-Kim-Bang, & Labat, 2012). This way, the game designers and teachers can easily relate to join the purpose of developing EG as they will communicate their ideas thoroughly. In contrast, the Educational Computer Game Design Model was proposed with game design components as Learn and Play, so that a balanced integration can construct good EG design (Osman & Bakar, 2012). Another author provided a conceptual framework for adapting collaborative multiplayer games by adopting the concept of multiplayer games and gameplay design principles (Sinkewicz, 2015). First, it is built on an existing model of players to provide insights of the audience, then, it develops a typology of gameplay themes to help designers with conceptualizing actions on the screen. Finally, it provides a framework with five main game design components, namely, learning objectives, story, 3D world, gameplay, and evaluation.

Recently, a framework is proposed for a blended learning environment to enhance learning outcomes and to provide a valuable strategy to facilitate both lecturers and students to obtain better educational knowledge (Jing, Yue, & Murugesan, 2015). Although it has proven a positive learning outcome, there is a need of more research work that can validate the learning-driven game design strategy. In contrast, an Activity Theory-based Model of Serious Games is proposed to provide a way to reason about the relationships between serious game components and the educational goals of the game it includes gaming activity, learning activity, and the instructional activity

(Arnab et al., 2015). The model explicitly accounts for the distinction between designer and instructor, therefore, the clarification of the role of the teacher/instructor in the game is needed. The game sequence representation follows the unified modeling language (UML) activity diagrams notation, which uses the shapes connected by arrows to represent the flow of the activities (Kühn, 2015).

MAIN FOCUS OF THE CHAPTER

Issues, Controversies, Problems

The gap between game design and educational design has become evident that to optimize the learning from serious games, pedagogical experts should be actively involved in the development process (Arnab et al., 2015). The experts involved in a development process is highlighted many times. It is a challenged and substantial to ensure that collaboration between game-based learning experts, theoretical experts, game designers teachers, learners, developers, and non-technical domain experts occurs. The sophistication in terms of popularity and budget of creating EG by scratch demands high level of production process is also challenging to researchers and game developers. Due to lack of infrastructure capabilities including hardware and software requirements, theoretical aspects in terms of pedagogical and instructional aspects are also very crucial in designing and development process. The game industry needs to insure that integrating an instructor in an EG can provide a useful feedback to users at a run-time significance (Sinkewicz, 2015).

Modelling and developing effective EG needs to have a clear understanding of what the desired learning outcomes are and to establish a transparent mapping amongst (Hainey, Connolly, Stansfield, & Boyle, 2011). To understand that, research methods and statistics are broad-ranging, complex, and interconnected with logical and scientific reasoning, understanding different representations of data, data analysis, interpreta-

tion of results and evaluation skills (Boyle et al., 2014). It is barely the case where domains such as game play, game environment, subject-matter, and learning theories interaction has been discussed in order to provide a holistic view of a particular game element. Mostly, the literature uses vaguely spread game elements that cover large number of relationships and domains.

The GBL and its diverse dimensions and characteristics makes it difficult to evaluate and model. However, evaluation remains the only way to verify if the educational targets are being achieved and to detect any functional vulnerability inside the learning game. If the gaps between EG community and industry, and between academia and industry is bridged, the game development efforts could benefit all communities, including industry (Arnab et al., 2015; Azadegan et al., 2014). Although evaluation process can be costly, there should be a pre-modelling strategy which can allow developer or designer to model out the elements and related elements, as well as domains that should be involved in EG actively.

SOLUTIONS AND RECOMMENDATIONS

Initially, a multi-domain framework was proposed as a result of systematic literature review (SLR) (Ahmad, Ab Rahim, Arshad, & Mehat, 2016). In SLR, there were fifteen (15) existing frameworks and models, game design elements/components,

domains, learning theories and subject-matter aspects were understood (Ahmad, Rahim, & Arshad, 2015). Systematic literature review (SLR) is a method adopted for characterizing frameworks; hence, five (5) steps proposed by (Khan, Kunz, Kleijnen, & Antes, 2003) has assisted in proposing the multi-domain framework are briefly shown in Figure 1. Figure 2 shows the multi-domain framework, which is composed of four major domains: (1) Game environment (GE), (2) Game play (GP), (3) Learning Theories (LT), and (4) Subject-matter (SM). Each domain is composed of game components categorized according to the domain's definition.

With reference to the proposed framework, this paper discusses implicit relationships which are not supported by literature and they are not explicitly mentioned. Therefore, the selected twenty-seven (27) relationships are mapped upon the four domains to be validated by game-based learning experts. The Table 1 shows the implicit twenty-seven (27) relationships statements with highlighted game components from framework.

The extraction of relationships was obtained by using the NVIVO software to 'code' the text in literature that contain the EG elements and domains. Using the coding technique through the paragraphs analyzed; provided discern sentences that explain the implicit relationships between elements and domains.

In validation process, the authors conducted eight (8) qualitative interviews with game-based learning experts (GBLe) who are highly experi-

Figure 1. Five major steps to provide an effective systematic literature review

Figure 2. The Multi-domain framework for modelling educational games

enced with this area of study. The interviews were transcribed and coded into NVIVO software to understand the emergence of new “nodes” in each relationship. This article discusses all four (4) domains as the major themes and its relationships as sub-themes. Each relationship has its components and those components are the existing “nodes” (highlighted as **bold**).

Each relationship is discussed by applying interpretive hermeneutic approach of qualitative study. Interpretive hermeneutic method is associated to interpretivism philosophical perspective of qualitative study, allowing understanding of in-depth experience of experts and self-reflexive for a constructive interpretation (Kafle, 2011).

Results and Discussions

There were 216 feedbacks collected from eight GBLe during the interview session. The interpre-

tations are presented with interpretive paradigm expectation, combining components suggested by GBLe and author’s understanding towards the relevancy with domains of framework. Hence, this self-reflection aspect is the goal of hermeneutic method and interpretivism paradigm approach. Due to limitation of word count, the authors have discussed three relationships to provide the reader with an understanding of interpretations.

- **Relationship: 16.** GBLe highly agreed that interactive learning environment should have the components, namely, instructional messages, pedagogy and story, and less load towards learner’s memory. Furthermore, multimedia environment elements such as sound, graphics and animation should also be integrated. When this occurs, there are fifteen (15) learning theories suggested to be integrated within

Table 1. The explicit relationships on the four domains and their elements.

#	Relationship Statement
1.	Flow Experience includes sense of control over activity , time distortion , increase learning , increased exploratory behavior , positive effect , and acceptance of technology .
2.	Players can be allowed to change game play to improve their performance and reach goals .
3.	Combining game play and narrative context provides cognitive resources , immersion , engagement , and perception patterns of narrative .
4.	If the difficulty level of a task in a game increases step-wise , the player forms knowledge and strategies , hence, reduces frustration .
5.	Restorative narrative structure include story realistic environment , sounds , and back story flashbacks where character or player talks to game directly.
6.	A game should have pedagogical foundations and proven educational practices such as fun and engagement to meet expectations of producers and consumers.
7.	Well-designed games expose learners to complex tasks , predesigned narrative content , story and has the ability to interact with others.
8.	Educational games have new concepts and logical learning progressions to provide set of skills and knowledge .
9.	Social capital has structural dimensions which has the patterns of social interactions between actors . Social learning involves observation , imitation , and modeling .
10.	The content of the games reflects the problem . Content transfer outside the games tends to be limited and low level.
11.	Educational games have explicit knowledge and conversation for learners.
12.	Simulated environments are integral part of learning, supports intellectual development , and it has recursive cycle learning .
13.	Multi-player role playing games support problem-based learning and visualization of their actions to solve the challenges.
14.	Games should have emotive environment , role models and challenges .
15.	Educational games should be gender-inclusive .
16.	Interactive learning environment can be evolves instructional messages , pedagogy and story to minimize chance of overloading the learner's cognitive system .
17.	Cognitive apprenticeship involves authentic practices . Authentic practice is a combination of activity and social interaction .
18.	Learner's construct learning in EG with the aid of visual and verbal representation occurring parallel to their memory .
19.	Behaviorism allows the change in behavior of player and change in environment shape to encourage learners in understanding concepts. Attribution theory allows observing and explaining the cause of event changed.
20.	Social constructivist approach in multi-player games involves interaction between players and social construction of knowledge .
21.	Cognitive load theory guides the design of multimedia learning environment and it has instructional messages embedded to help avoid overloading memory of learning.
22.	Cognitive load optimization can be achieved with less irrelevant multimedia elements .
23.	Learners experiencing bad usability in task flow , eventually sacrifice attention and cognitive activity due to limitation of working memory capacity .
24.	Scaffolding can be combined with graphical presentations to lower player's cognitive load .
25.	Problem solving skill is also known as discovery learning , increases in and across games but it is difficult to use it outside the game.
26.	To ensure the player's behavior does not change in the gaming world, adaptive features should be transparent.
27.	Game play , game environment , subject-matter and learning theories are important in educational games .

this environment, i.e. motivational learning (behaviorism, collaborative learning, cooperative learning, guidance theory, intrinsically rewarded, social constructivism), cognitive, cognitive apprenticeship, constructivist learning, contextual thinking, experiential learning, problem solving, bloom's taxonomy, creative thinking, innovating thinking, and critical thinking. Since it plays a role in cognitive, the player's thinking and memory is also related to this concept. Moreover, it involves cognitive (knowledge), affective (attitudinal) and psychomotor (skills) domains in taxonomy, which works concurrently with respect to learner's playing games. Finally, this relationship is not amended and it involves components from GE, and GP domain.

- **Relationship: 25.** GBLe greatly supported with new suggestions to it. The problem-solving methods are implemented in EG as assignments or activities; which can be applied in real life as the learners adapt innovative approaches, logical situations, and appropriate knowledge selection to overcome the problem outside. Two emerging nodes were the way the knowledge is transferred inside and outside of EG. 'Transfer' is defined as the process of knowledge/skills acquired in one context in a new or varied context. Transfer is divided into a few types in which the knowledge context can be changed. Low road transfer (also known as reflexive transfer), involves the triggering of well-designed routines by stimulus conditions similar to learning context. High road transfer (mindful transfer) involves a deliberate amount of effortful abstraction and searches for connections. Moreover, another expert mentions about CPS factors (Creative Problem Solving); a mental state, problem reframing, multiple idea facilitation, and inducing change of perspective. The relationship is not amended and it involves the components from SM and LT domain.

Verifying the framework domain selection, one question involved all four domains. To ensure correct adoption of those domains, validation was scaled from 1 to 10 (1 as lowest and 10 as highest). The importance to collaborate game plays (GP), game environment (GE), subject-matter (SM) and learning theories (LT) in educational games.

Relationship statement: 27. *"I would give 10, because this is what makes an ordinary game different as compared to the educational game. Because in EG, we have certain learning outcomes that we need to achieve and in order to achieve the learning outcomes, we need to make sure that the learning environment has been taken care of in such a way. For example, the interactive natures of the game and also certain learning theories have been inserted in the game. And then, of course we need to have the expertise of subject-matter expert because we need to tailor the game, you know, for each and every subject. Okay, therefore I think this is very important all together and this must be considered in the educational games."* (Game-based Learning Expert's Opinion)

FUTURE RESEARCH DIRECTIONS

Modeling language for the behaviors of educational game is to our knowledge not available. Another field that may be of benefit to educational game development is model-based testing (MBT). MBT is a method to improve the testing process of software by referring to the models for guidance (Hemmati, Arcuri, & Briand, 2013; Timmer, Brinksma, & Stoelinga, 2011). Verifying effectiveness of the game has been explored many times (Omar & Jaafar, 2010) and the most common method is a combination of acceptance testing and quantitative/qualitative research methods. Other methods such as unit testing, white-box testing and verification using models are yet to be well known.

Further research can also be performed on using Model-Driven Engineering (MDE) (Tang & Hanneghan, 2011) in development of EGs; where,

1) modelling languages can be used at different level of modelling from requirements to detailed design, 2) model for traceability from requirements to code, and 3) verification of educational games effectiveness from models.

CONCLUSION

This chapter has discussed various types of existing frameworks and models which aid in developing EGs. Due to lack in explicit relationships amongst game components and vaguely spread elements, it is difficult to examine the importance and relevancy with other game domains. Therefore, this chapter proposes a multi-domain framework and twenty-seven explicit relationships involving four major domains, game play, game environment, subject-matter, and learning theories. To verify those relationships, interviews with game-based learning experts were collected. Due to their expertise in areas of teaching, game play, environments, and theoretical aspects of EG, it was an informative data collection. The interviews were interpreted using interpretivism paradigm and hermeneutics method is used to illustrate each relationship in context with the four domains. Finally, this chapters provides an insight on how the modelling of an existing EG or a new EG can be done by understanding different elements and their relations with other elements and domains of game to thoroughly understand the theoretical and practical concepts of EG before implementation.

KEY TERMS AND DEFINITIONS

Bloom's Taxonomy: it is known as a multi-tiered model of classifying thinking according to six cognitive levels of complexity.

Game Environment: A dimension which collaborates game rules, objectives, subject, and theoretical aspects together as a whole to provide an interactive flow of activity.

Game Play: This is where the rules and regulations of EG.

Hermeneutic Circle: The iterative process of interpretation, reflective writing, and reading to provide the details of the whole phenomenon discussed.

Hermeneutics Method: An interpretive and concentrated research on historical meanings of experience and their developmental and cumulative effects on individual and social levels. Iteratively taking parts of interdependent meaning and the whole of their formation to achieve understanding.

Interpretivism: The belief in multiple observations of reality, subjective and socially constructed through language, consciousness and shared meaning.

Model-Driven Engineering: A software development approach, focusing on creation of models that represents the system-under-study (SUS) and subsequent generation of fully-working software artefacts from these models.

Subject-Matter: The teacher/learner and the subject embedded in the EG.

INTRODUCTION

The intersections of the human body with the latest computing technologies have opened up numerous debates on what it means to be human in our technologically mediated societies. Classical dichotomies body/mind, human/machine, natural/artificial seem to be dissolving in contemporary Western societies, and the limits of the “organic” body become difficult to establish. The result is a new ontology of the body. Practices such as cloning, reproductive technologies, robotics and implants, among others, have become familiar facets of our global societies that place the human body in an assemblage with technology. Moreover, the world is dominated by technological images that have become part of our daily life and that have created new spaces for representation (and eventually for living), such as the virtual world or cyberspace.

The present paper privileges the body as being key to understanding our intricate relationship with the latest advances in computing and robotics in contemporary societies. In doing so, it critically entrenches with a specific movement called “new materialism”, whereby matter is not perceived as fixed or passive but rather as a dynamic and shifting process. Specifically, I will stress the importance of approaching popular representations of the so-called “body in transit”, as this shifting idea of corporeality reflects contemporary anxieties and interests fueled by the relationship between physical bodies, computing technologies and gender representation. For this purpose, this work will focus on the notion of the fluid body

or “body in transit” as represented in US popular Sci-Fi cinema to contend that this posthuman figuration is still informed by gendered practices and dominant structures of power, despite its hybrid nature.

Computing and media technologies are everywhere and extend to the human body, affecting the way gender has been traditionally understood. As some feminist research has highlighted, technology is affected by gender relations. Technology in general has been traditionally considered as a sign of men’s power and masculinity defined in terms of technological capabilities. Nevertheless, current discourses have provided new definitions of technology, of gender identity and of what being human means. This inevitably challenges traditional power associations between men and technology. As Barbara Becker argues, the “difference between natural and artificial, real and virtual, material and immaterial phenomena is not an ontological one, but changes according to technological improvements and methods of communication” (Becker, 2000, p. 361). In the same way, definitions of gender also change with time, affected by technological developments.

Cybernetics, as a set of media technologies, offers grounds from where to analyze gender in contemporary contexts. Cyberspace has offered numerous possibilities for the redefinition of the human body outside traditional boundaries, suggesting a liberation of socio-cultural constraints. This is precisely the concern of many feminist theories that aim at deconstructing the human subject from binary polarization, implying the dissolution of sexualized identities in cyberspace.

Specifically, the discipline called “cyberfeminism” sees cyberspace as a gender-neutral site that enables women to communicate and act outside the constraints of male-dominated physical realms. Sadie Plant and many other cyberfeminists offer optimistic—sometimes utopian—views of the relationship between women and technology in the virtual age. In her essay “On the Matrix: Cyberfeminist Simulations,” Plant argues that virtual worlds “undermine both the world-view and the material reality of two thousands years of patriarchal control” (Plant, 2000, p. 265).

Yet, contrary to cyberfeminist postulates about the neutrality of cyberspace for gender relations, popular discourses like Sci-Fi cinema normally rely on this distinction when depicting the interaction between the body and computing technologies, inevitably adopting gender dualisms. Cyberspace is constructed by existing social, cultural and economic structures, and gender stereotypes and sexed body descriptions are normally employed in order to suggest authenticity to these visual texts. This is not to say, however, that popular discourses do not offer fresh instances of flesh and computing technologies. As argued here, contemporary US cinema has overcome old visualizations of static and gendered cyborg figures as represented by figures like *The Terminator* or *Robocop*, and offers instead images of fluid subjectivities as embodied by characters that live in transit between reality and virtuality, as shown in movies like *The Matrix* (1999), *eXistenZ* (1999), *Avatar* (2009), *Surrogates* (2009), *Inception* (2010), *Tron: Legacy* (2010) or *Ex Machina* (2015), among others. This idea of fluidity is achieved by a series of visual and narrative strategies that partly help overcome the obstacles posed by cultural products that, due to their conditions of production, cannot break away from the hegemonic assumptions of gender identities. It is precisely the paradoxical nature of cinematic bodies in transit what I intend to emphasize here, especially since they articulate contemporary cultural and gender concerns.

BACKGROUND

In cultures where the organic “natural” body is gradually disappearing and giving way to fruitful instances of flesh and machine, the current outburst of debates on corporeality becomes, if less, paradoxical. The body remains at the core of many contemporary analyses, proving to be a useful tool for examining culture and gender. As Arthur Kroker contends, “[w]hile the triumph of mass media, particularly television, may portend a future of pure simulation, the overriding cultural reality is that the image machine is itself haunted by memories of the body” (Kroker, 2012, p. 1). The body becomes, then, an archive from where to analyze contemporary society. Yet, the new body that emerges—also known as the posthuman body—is perceived as a contested notion linked to fluidity, hybridity and complexity. Kroker talks about “body drift” to refer to the fact that we no longer inhabit a body in any meaningful sense of the term but rather “occupy a multiplicity of bodies—imaginary, sexualized, disciplined, gendered, laboring, technologically augmented bodies” (p. 2). The idea of the fluctuating, fluid or hybrid body has been theorized by scholars like Donna Haraway, Katherine Hayles, Judith Butler and Rosi Braidotti, among others. These writings open up a new tradition of critical feminism that addresses the complexity of our bodies in technologized cultures.

One of the most striking examples of a hybrid body is that proposed by Donna Haraway in her material-semiotic approach “Cyborg Manifesto” (1985). As she sets out to defend, the cyborg is about transgressed boundaries, potent fusions and dangerous possibilities. The popularized cyborg figure has greatly stimulated many insights into the gender/power relations with technology, leading to consider the possibilities that technoscience offers women. Indeed, as she defines it, the cyborg is a fictional hybrid of machine and organism, “a creature in a post-gender world

[which] has no truck with bisexuality, pre-oedipal symbiosis, unalienated labor, or other seductions to organic wholeness through a final appropriation of all the powers of the parts into a higher unity” (Haraway, 1991, p. 150). The technological world frees women’s representations, in a sense, from patriarchal domination. Along with Haraway, postmodern feminists like Judith Butler have sought to deconstruct binary systems by reconceptualizing gender as unstable and performative. She considers corporeality as an act of imitation. Butler affirms that “the regulatory norms of ‘sex’ work in a performative fashion to constitute the materiality of bodies and, more specifically, to materialize the body’s sex, to materialize sexual difference in the service of the consolidation of the heterosexual imperative” (Butler 1993, p. 2). Sex, then, becomes one of the norms that “qualifies a body for life within the domain of cultural intelligibility” (1993, p. 2). In this sense, and very much like the cyborg figure proposed by Haraway, the performative body “has no ontological status apart from the various acts of identities which constitute its reality” (Butler 1993, p. 228), suggesting the fluidity of our identities.

There is a strand of feminist practices, called “material feminism” or “new materialism” whose writings become of special interest for the argument of this paper. For Hayles, Braidotti and other materialist theorists, the body becomes fundamental for analyzing contemporary human-machine interactions. Subjectivity and the body are decentered as distinct units, troubling the information/material separation. While technology and biology interact with other, the body stands as a useful tool from where to examine complex relationships with media and computing technologies. Accordingly, cyborgs are not only about people with machine legs or arms. As Braidotti affirms, cyborgs are no longer the space of Sci-Fi but they define our social framework at all levels: from medicine, to telecommunications, finance and modern warfare (2002, p. 17). She uses a multi-layered definition of the cyborg, which includes today fragile bodies that interface with computer technologies at posthuman levels.

Moreover, the new technologies offer prosthetic extensions to our bodies in the form of mobile phones, Internet networks and the like, which open new ways of challenging the classical humanist mode of representation (Braidotti, 2002, p. 18).

In a similar vein, Hayles argues that cyborgs indicate a culture in which information has got under our skin. Bodies are forms of information interacting with other forms of information. In *My Mother was a Computer*, Hayles talks about the ineludible interaction between subjectivity and materiality:

[intelligent machines] are neither objects to dominate nor subjects threatening to dominate me. Rather they are embodied entities instantiating processes that interact with the processes that I instantiate as an embodied human subject. The experience of interacting with them changes me incrementally, so the person who emerges from the encounter is not exactly the same person who began it. (Hayles, 2005, p. 243)

Accordingly, the difference between human and technology has become difficult to distinguish (2005, p. 228) and the (virtual) body that emerges speaks the language of 21st century cybernetics.

In offering a new definition of the body, these theories refuse the post-apocalyptic nihilism postulated by theorists like Jean Baudrillard (1994), who advocated for the dissolution of the material body in hypermedia societies where the real and the imaginary collapse into each other. Corporeal feminism is also against the movement known as “transhumanism” which envisions the possibility of enhancing human potential by means of science and technology. Instead, Hayles, Braidotti and the “new materialisms” provide us with detailed analyses of the impact of computation on embodiment and subjectivity, aiming to move toward a materialist reconfiguration of the posthuman, or an embodied posthumanism. Within these writings, the posthuman body becomes an icon of the 21st century cybernetic culture. In other words, these works present a return to the body, yet a hybrid or fluid body that troubles the information/material

separation, a boundless body, a body in transit. Specifically, the posthumanist mode is articulated by recent critics like Cary Wolfe (2010), Francesca Ferrando (2013), Patricia MacCormack (2012), or by Rosi Braidotti (2013). In her latest book, *The Posthuman* (2013), Braidotti deals with the posthuman predicament as a way of understanding our plural identities in contemporary mediated societies. The aim of the posthumanist thinker is, according to Braidotti, to go beyond traditional humanist limitations and embrace the risks that “becoming-other-than-human” entails. Throughout her work, Braidotti recognizes that the figure of the posthuman is ambiguous and caught up in projections of desire or fantasies of domination and disembodiment. Yet, in a similar way as Haraway’s cyborg, the posthuman as articulated by Braidotti can be used as a liberating force that overcomes the negativity of contemporary practices that reduce sexualized, racialized and naturalized “others” to disposable bodies (Braidotti, 2013, p. 15).

In short, the body in transit between reality and cyber-reality becomes fundamental for analyzing contemporary human-machine interactions, as I will attempt to illustrate in the next section.

BODIES IN TRANSIT: THE VIRTUAL REALITY FILM

Due to the ever-increasing presence of science and technology in our daily lives, the themes, topics and ideologies traditionally associated to Sci-Fi have been imported to popular culture. Accordingly, the creation of spaces such as virtual reality, the Internet or cyberspace, has allowed for challenging representations of the human body, sometimes conceived as pure information. While a common agreement among feminists is that Sci-Fi offers in many ways a traditional vision of gender relationships, and women are still relegated to a secondary position in such texts, contemporary movies showing cyberspace particularly offer opportunities for understanding the complex relationship between humanity and information technologies. Wrapped in hypermedia

societies, subjectivities seem to be disturbed and unable to distinguish reality from simulation, affecting the way the body is culturally understood in these films.

Many contemporary Sci-Fi films follow cyberpunk tradition of the 1980s and present cyberworlds in which the traditional body is contested. The movement known as cyberpunk stresses the superiority of the mind over the body, suggesting the elimination of the material body. Indeed, the term cyberspace is deeply entrenched with this literary movement whose main representative is William Gibson. It first appeared in *Neuromancer* (1984) to refer to “a virtual hallucination experienced daily by billions of legitimate operators” (Gibson, 1984, p. 69). For most cyberpunk fiction, the body is not a biological essence but it is regarded as pure mind. The Gibsonian concept of cyberspace has begun to be felt as tangible and representative of our social reality, which seems to be located somewhere between fiction and reality. In this sense, it is a problematic and ambiguous domain. On the one hand, cyberspace has opened numerous possibilities for the definition of the human body outside traditional boundaries, suggesting a liberation of socio-cultural constraints. On the other hand, and since such space is constructed by existing structures, stereotyped images and descriptions of bodies are normally used. Even in cybernetic contexts, where the blurring of frontiers is taken to an extreme, gender inequalities are to be found. Dani Cavallaro addresses these issues when he affirms that cyberpunk’s approach to gender roles is highly ambiguous, especially if we consider some “conflicting interpretations of the gender and sexual attributes of some of cyberpunk’s best-known characters” (Cavallaro, 2000, p. 121). Cavallaro is referring to characters like Molly in *Neuromancer*, whose gender connotations are ambivalent and it is up to the reader to decide if she can be considered as an image of the liberated woman or as a stereotype.

With the help of the latest special effects, Sci-Fi is symbolic of the attitudes of society to technological advances. Specifically, by focusing on the trope of the body in transit, contemporary Sci-Fi films

provide the ideal forum from where to articulate cultural anxieties regarding the fluid and complex relationship between humanity and technology. In this sense, this cinematic genre can be considered as an important cultural referent that foregrounds questions of gender and identity at work in contemporary society. There has been, especially in the last decade in the USA, a proliferation of films dealing with cyberspace in which men and women undergo virtual experiences. These films often rely on the disorientation of the senses caused by the interaction between body and technology at the end of the millennium. This disorientation further suggests that we have lost control of our material bodies and of the world around us, urging us to find new instances of representational regimes for the intrusion of technology in our bodies. Many films of the end of the 1990s and the beginning of the 21st century like *Virtuosity*, *The 13th Floor*, *The Matrix*, *Avatar*, *Tron: Legacy* or *Disconnect* offer significant representations of the digital media in the form of the Internet, virtual reality, computer games, digital databases, or social networks. This ability to simulate our experience of reality ends up in the confusion between reality and fiction, a main motif in films dealing with cyberspace, in which characters—and spectators by extension—are frequently unable to perceive what is “real.” Films dealing with hypermedia operate between two spaces (the real and the simulated) that sometimes merge, which affects the way gender is constructed in them.

The idea that the real self becomes a simulation in cyberspace opens great possibilities for the depiction of challenging body figurations, suggested by films that deal with ontological issues, like *Vanilla Sky* (2001), *Fight Club* (1999), *Dark City* (1998) or, more famously, *The Matrix* trilogy (1999; 2003; 2003) and *Inception* (2010). In these films, the fluid interaction of the body with cyberspace complicates issues of gender depiction, partly because spectators—like characters—are sometimes unable to distinguish the reality from the virtuality of the worlds that are displayed. The ambiguity posed by the hybridity of these bodies due to their contact with digital media is

explored in the cyberthriller *Strange Days* (1995), whose protagonist, ex-cop Lenny, accidentally enters a virtual experience that disturbs him and introduces him in a dark web of murder and blackmail. In *Hackers* (1995) their protagonists have a quasi-erotic but troubling relationship with their laptops and personal computers, which become extensions of their bodies. More problematic is, however, the brain expansion implanted into a mentally retarded man in *The Lawnmower Man* (1992) or the massive load of information that the protagonist of *Johnny Mnemonic* (1995) stores in his brain, entailing rape, murder and killing. The earlier *Videodrome* (1983) suggests the manipulative effect of video images literally inserted in the male body, which causes hallucinations to the protagonist. This trope persists in more recent films like *Disconnect* (2012), which shows how people experience the negative sides of today’s wired and globalized world. In this sense, these films coalesce with Christine Ross’s comments on the mutability of the body at the end of the millennium, partly due to the fast-expanding integration of technologies of information into everyday life (Ross, 2001, p. 28).

As suggested before, Hayles’s or Braidotti’s ideas of embodied virtuality may well be utilized here as a way of understanding the complex ways in which the body is interpenetrated with information patterns, suggesting reconfigurations of traditional body markers. Moreover, this confusion talks about a new—yet disturbing—relationship with computing technologies, while hinting at the problematics of new gender representations. Indeed, male cyborgs appearing in many films from the end of the 20th and beginning of the 21st century become key figures for the exploration of new values ascribed to manhood. This idea is illustrated, for instance, in the film *eXistenZ* (1999) whose protagonist, Ted, departs from conventional representations of male leading figures on screen in the sense that his constant worries over the ways the virtual game affect the materiality of his body (he needs to have his body drilled in order to enter cyberspace) cause destabilization and puzzlement. This situation suggests the contemporary crisis

of masculinity at work in US society at the turn of the century, precisely when new definitions of masculinity appeared in the public arena. Likewise, *The Matrix* trilogy proposes a new model of masculinity: Neo's androgynous and malleable body and his troubled subjectivity do not match conventional portrayals of the action hero. The virtual hero is called Neo, and this encourages spectators to expect a rather innovative personality and/or behavior, or at least something new concerning his physical aspect. The innovation is easily perceived in his looks, which confuses viewers at first with his gender identity. He can be also said to be the embodiment of the "New Man." The idea of playing with conventions is also explored in *Tron: Legacy* whose female hero, Quorra, adopts traits traditionally associated to masculinity, only to show that she is a strong, resourceful and accomplished female warrior.

By subverting earlier pessimistic feminist approaches that stressed the "masculinization" of media technologies, contemporary Sci-Fi offers a fresh relationship between women and digital technologies. Significantly, an outburst of films showing virtual realities and cyberspace appeared in the late 1990s, a time when there was a remarkable shift in power from men to women in technological development, as cyberfeminists noted. In these films, women are seen as creators of computing technologies, feeling comfortable when interacting with the new technologies, as it is shown in *eXistenZ*, *The 13th Floor* or *Inception*, to give some remarkable examples. In this sense, the Sci-Fi genre holds the power to subvert the sad reality of women's marginalization in present day technologized societies. As Ivana Milojevic argues when analysing visions of the future and virtual reality technologies: "women's images and selves are being created and valorized in the minds of adolescent net surfers", the net being "a place for the gathering of sexual harassers and paedophiles". Milojevic foresees a future world "where women will no longer be needed at all, creating the womanless real world and women-filled virtual world" (Milojevic, 2010, p.39). However, in these films, cyberspace is presented

as an innovative site where women can enjoy of an intimate and fruitful relationship with computing technologies.

In spite of women's visible engagement with various media technologies, mainstream virtual reality films do find real obstacles when representing alternative subjectivities and new body politics, what echoes at existing socio-material power inequities. The main obstacle may well derive from the fact that mainstream cinema presents digital worlds that are meant to simulate a still gender-biased reality. In order to confer meaning to the visual text, screened bodies need a referent and, while the reality in the film may be constructed as very different from our current reality, it is still a simulation of it. Precisely, in *Metamorphosis*, Braidotti uses film to illustrate the intensification of the gender gap and the polarization between the sexes in virtual contexts.

This inability to abandon old ideas of the body and to evolve in terms of gender depiction is shown in *Avatar*, whose protagonist, Jake, is a disabled ex-soldier who jacks into a vigorous alien-hunter body, and whose supremacy remains unquestionable throughout the film. The female hybrid character, Neytiri, is a brave and spiritually strong being, although nothing is known about her outside her sentimental relationship with the hero. Avatars are still constructed around gender stereotypes in movies. Women are simply ignored in *Tron* (1982), considered the first movie to visualize the virtual reality, or in *Virtuosity* (1999), where the only digital image of women (called Sheila 3.2) serves the mere purpose of sexual lure. The character of Lara Croft in the film adaptation of the popular video game *Tomb Raider* (2001) is but another more example of the fetishization of the female virtual body.

Mediated or virtual bodies appearing in many contemporary movies have paradoxically been designed according to Western standards of beauty, which problematizes their claims for a liberating body image. The film *Surrogates* (2009) shows how most humans live in isolation and use fit, healthy and attractive humanoid robots through which they interact with society,

while they preserve the integrity of their bodies in the comfort of their own homes. While real humans are depicted as possessors of fat and unfit bodies, surrogates are beautiful, healthy beings nicely dressed and visually appealing, reaffirming patriarchal assumptions about sex and gender. When dealing with contemporary societies, Susan Bordo states that “our bodies are trained, shaped and impressed with the prevailing forms of (...) masculinity and femininity” (Bordo, 1993, p. 91). By regimes of dieting, makeup, exercise, dress, cosmetic surgery, women, and increasingly men, try to sculpt their bodies into shapes which reflect the dominant societal norms. In *Surrogates*, bodies are disciplined to correspond to a social ideal, they remain invulnerable and do not suffer the pains of cosmetic surgery, dieting, or the destructive effects of natural disasters and other threats of extinction. Surrogates function as body prostheses that perform pre-established patterns or norms of beauty and success, while preserving an invisible, decadent and ageing human race. Another film showing this problematic is *The Hunger Games* (2012) where the main female protagonist, Katniss, plays with the idea of beauty as a social construct to suggest the artificiality of gender.

Some feminist researchers have pointed out the paradoxical nature of the material body as inscribed in cyberworlds. For instance, Ann Balsamo (1996) argues that the body in virtual reality does not erase gender or race markers (1996, pp. 125-127). The risk of falling into body-essentialism has been also noted by theorists on new technologies (Becker, 2000; Boler, 2007), who affirm that users normally rely on stereotyped images of the body while searching for new concepts of identity in virtual worlds. Van Loon has underlined the importance of embodiment in certain media contexts and contends that it should be understood as an “effect” of our mediated being, and as such, susceptible to transformation (2008, p. 100). When referring to virtual reality, Van Loon opts, then, for analyzing embodiment in close conjunction with disembodiment as both variations of the virtual (2008, p. 127). In addition, new media theories provide evidence of the impossibility of totally

transcending the body in cyberspace. Murphie and Potts argue that virtual reality systems rely very often on the perceptual mechanisms of the body in order to work (Murphie & Potts, 2003, p. 119): “we feel we are in virtual space only because our senses tell us we are—through our eyes, our hands and our ears. Even our haptic senses pick up the internal arrangements of our bodies, subject to things like movement or gravity to tell us we are in VR” (2003, p. 120).

The idea of simulated worlds where the real merges with the imaginary does not apply to gender representation in mainstream virtual reality films. Gender is, ironically, paralyzed in the hyper-technological panorama where everything seems to mingle with reality. This may be a consequence of the need to have a referent in a world where our identities are fragmented as a result of our close interface with the newest media technology. The body in transit is still the repository of marginalized gendered and sexed practices.

FUTURE RESEARCH DIRECTIONS

Body imagery in mainstream Sci-Fi films is still subjected to hegemonic definitions of masculinity and femininity, and show up the inability to offer gender free portrayals. As a popular discourse, Sci-Fi mirrors effectively cultural anxieties concerning the posthuman subjectivity as articulated by “new materialists”. A research on how the posthuman body is described and/or depicted in other contemporary discourses, such as video games, written Sci-Fi or *auteur* cinema could supplement this work and explore the intricacies of pioneering works by Braidotti and Hayles.

CONCLUSION

Accepting that our bodies have been significantly altered due to technology may not always be comforting, but can mean a solution to end up with the oppressive old rules of the gendered body. As I have attempted to illustrate, the Sci-Fi proves to

be aware of the paradoxes of body representation on screen. Popular Sci-Fi showing virtual environments do not totally undermine dominant gender values and, consequently, the body is never totally “invisible” in them. Even the most intrusive users of technology—as happens in films like *The Matrix* or *Surrogates*—seem to be stimulated by the patriarchal demands on the physical body. As a result, the post-gender alternative proposed by some researchers does not find a real place in this popular genre. In this sense, cinematic bodies in transit cannot be regarded as embodiments of a positive posthuman subjectivity, or as advocates for the politics of affirmation as described by Braidotti and other feminist materialists. The idea that different is positive is not fully articulated in these bodies, and they still follow established and oppressive conventions. Braidotti makes a call for posthuman thinking: “these non-profit experiments with contemporary subjectivity actualize the virtual possibilities of an expanded, relational self that functions in a nature-culture continuum and is technologically mediated” (2013, p. 61). Unfortunately, this is not the spirit of contemporary capitalism, a system that promotes uniformity and conformism to the dominant ideology.

Along with this conclusion emerges another one, less pessimistic. While the Sci-Fi film suggests the importance of keeping the materiality of our bodies, it also demonstrates that the interaction between media technologies and our subjectivities is possible and that new ways of understanding the reality of our bodies need to be found. While Hayles, Haraway, Plant and other feminist theorists have proposed ways in which the virtual subject can be redefined, it is still necessary to give attention to the ways popular culture faces the reality that our bodies interfere with technology. After all, most of the films commented here show hybrid and fluid bodies that live in transit reality and virtuality, that are vulnerable, and that project our inner conflicts with technology. Popular Sci-Fi needs to find a space between hegemonic discourses and the “space-off” that Sci-Fi allows, in relation to the representation of the posthuman body.

ACKNOWLEDGMENT

The author wishes to acknowledge the funding provided by the Spanish Ministry of Economy and Competitiveness (Research Project “Bodies in Transit”, ref. FFI2013-47789-C2-1-P) and the European Regional Development Fund for the writing of this essay.

KEY TERMS AND DEFINITIONS

Cinematic Cyborg: An image provided by films (mainly science fiction) in which flesh and machine combine, representing the relationship between material bodies and media technologies.

Cyberfeminism: Discipline within feminism that sees cyberspace and virtual reality as neutral realms in terms of gender. This school of thought

visions a society beyond gendered bodies where women can communicate and act outside the restrictions imposed by patriarchal societies.

Gender Identity: A person's sense of oneself as male, female, both or neither, resulting from culture and other external and/or internal factors.

Material Feminism: A discipline that considers the physical body as fundamental for the articulation of gender and for the analysis of contemporary human-media interactions. Key authors are Katherine Hayles or Rossi Braidotti.

Posthuman Body: A contested notion that stands as an icon of the fluidity, hybridity and complexity of corporealities in contemporary technologically-driven societies.

Virtual Body: An inorganic entity with human shape made of information and placed in cyberspace.

Virtual Reality Film: A visual text that shows, and normally relies on, cyberspace in the form of computer games, the Internet, digital databases and the like. It allows for a visualization of the complex relationship between humanity and information technologies. Examples may include *The Matrix*, *eXistenZ*, *Avatar*, or *Tron: Legacy*.

Gender Differences in Advertising Engagement Using the Case of Facebooks Ads

Eva Lahuerta-Otero

University of Salamanca, Spain

Rebeca Cordero-Gutiérrez

University of Salamanca, Spain

INTRODUCTION

In the last decades, the use of 2.0 technologies has dramatically changed the landscape of a globalized world. Social networks have reached a predominant role within the communication channels as users can get instant access to updated information. Social network profiles grow every second. According to Social Media Today (2015), nearly half of the global population (3,175 billion people) is an active Internet user. Social media have become increasingly fashionable with 2,206 billion active users, 87.2% out of which using mobile platforms. This means 12 new active mobile social users join these platforms every second, meaning one million per day! Therefore, billions of users and companies, with multiple social accounts, are constantly connected.

Regarding the social network concept, the literature provides a variety of definitions of this notion. According to Boy and Ellison (2007), virtual social networks or social network sites are a service based on a web platform that allows people to create their one public or semi-public profile within a limited system. It also allows the possibility of creating contact lists and visualizing the lists of other friends. Other authors also state that social network allows an information sharing and relationship generation by means of interaction with members with common interests (Bigné *et al.*, 2010; based on Preece, 2000; Wiertz & De Ruyter, 2007).

From a set of different social network categories, this study focuses on the horizontal network (ONTSI, 2011), where the use is not restricted to a group of users with a particular interest (gastroonomy, cooking or travelling social networks, for example). Users join horizontal social networks, Facebook in this case, with communication or entertainment purposes.

The web now is a participatory community where not only users, but also companies can co-create, share and modify content. According to Porter Novelli (2012), Spain is the third worldwide country in terms of active users (77%) and 83% of Spaniards are willing to follow a brand on a social network, which is the highest rate in Europe. Consequently, companies and brands invest on social networks to promote their products and to improve customer engagement (Camarero & Cabezudo, 2014). Thus, these platforms emerge as important marketing and communication tools to influence customers. By analyzing users' comments on social networks, firms can discover their tastes, wishes and needs. Therefore, firms can better understand users' behaviors and they can assess satisfaction levels within the purchase process (Kozinets, 2002). By knowing customers better, companies can design specific advertising campaigns addressing the needs of the digital users. These commercial tools provide time and cost savings (Malhotra and Peterson, 2001) and they have a strong personalization power in terms of

DOI: 10.4018/978-1-5225-2255-3.ch293

promotions for individual consumers (Ailawadi *et al.*, 2009; Kannan & Kopalle, 2001)

Social media marketing is a core part of any firms' marketing strategy. With global, connected customers, companies are aware of the need of generating leads that increase purchase intentions by means of social media. Online customer loyalty is hard to get, so marketers are implementing multichannel marketing strategies to generate advertising impacts on any means available. Although traditional media (TV, radio, press) remains important, digital ad spending will reach 30% of total advertising expenditures in 2016 (eMarketer, 2013). Therefore, academics and practitioners need to know how to target customers effectively.

Although Facebook ads platform is a powerful and widely used marketing tool, there is little research about the effectiveness of social marketing campaigns depending on gender. Thus, the purpose of this study is to determine if there are significant differences on Facebook ads' performance according to gender. The article describes the most important metrics regarding social media advertising and, by means of different case studies, it assesses which gender group has greater engagement and performance.

BACKGROUND

Not only do men and women communicate differently, but they think, feel, perceive, react, respond, love, need, and appreciate differently (Gray, 2009, p5).

The last several decades have brought many changes, including but not exclusively the technological ones. The role of women in society has evolved internationally. Around 70% of all working-age women work outside of the home (Meaning, 2013) and they represent the majority of professional workers in many countries, including Spain (Sheehan, 2013). Not only have women changed their working roles, but they have also increased their influential power as consumers.

Women have the decision or influence power in 85% of all consumer goods (Marketing to Women Quick Facts, 2011). However, even if men and women are more equal today, they respond to completely different stimuli when viewing and evaluating advertising messages (Popcorn & Marigold, 2000).

Moreover, women and men use different parts of their brains when processing information. Whereas men processing distributes across the entire brain, women's processing focuses on the frontal lobes, where humans also process multi-tasking (Hotchkiss, 2008).

Since advertisers know men and women process information differently, they have historically relied on stereotypes to establish links with consumers so they can process the information correctly. It is efficient to use gendered stereotypes in advertising because consumers immediately associate the brand, product or service within a sexual category (Sheehan, 2013). However, in terms of social media use, men and women exhibit similar rates: In America, 68% of women and 62% of men use social network sites (Perrin, 2015). Nevertheless, women seem to be more active as they like and share much more content in social media, compared to men (53% versus 34% in 2013) (Casas, 2014).

Gender is not a mere biological concept. It refers to a physiological phenomenon regarding the learned behaviors in relation to gender and men and women's attitudes (Gerrig & Zimbardo, 2002). Men and women tend to have different attitudes and behaviors not only as a result of genetics, but also because of their socialization experiences (San Martín & Jiménez, 2011). Women are usually more involved in shopping activities and they engage more in social media (Cordero-Gutiérrez & Santos-Requejo, 2016). Mazman & Usluel (2011) also observe that gender helps to explain differences in the usage patterns of social networks.

One of these stereotypes has to do with women and computer-related studies and jobs. Regarding attitudes towards computers, women usually exhibit less positive attitudes, as they have higher

levels of computer anxiety (Comber *et al.*, 1997; Kirkpatrick & Cuban, 1998). Women usually like and use computers less than men (Brosnan, 1998; Collis, 1985; Durndell *et al.*, 1987; Meredith *et al.*, 1998) and literature suggests that computer-related careers and information technologies are male stereotyped (Durndell & Lightbody, 1993).

In terms of social media usage, men prefer it to for doing business or dating, whereas women prefer to stay in touch with family and friends, to share content and to entertain themselves. Women tend to have a stronger positive attitude toward brands, and they follow brands more frequently than men do in order to get promotions and discounts. (Simmons Connect, 2013). In terms of time spent on social media, women statistically spent more time (3 hours on average) compared to men (2 hours) (Sánchez-Valle & Frutos-Torres, 2012).

According to FinancesOnline.com (2014) women dominate several areas of social media:

- There are more women in top social sites: Facebook, Twitter, Tumblr, Instagram, and Pinterest
- Women use social media more often daily: 30% of online U.S. women check their profiles several times in a day versus 26% of online U.S. men
- Women interact with brands more often: 55% of online U.S. women access deals compared to 36% of online U.S. men
- 58% of those who consume news in social media are women
- More women use smartphones and tablets to access social media
- Women drive the trend towards visually oriented social sites such as Instagram, Tumblr, and Pinterest, which are the three fastest growing social media networks today

Regarding Internet advertising, some authors believe men prefer web ads to traditional media because digital ads provide interactive features they enjoy (Bezjian-Avery *et al.*, 1998). Conse-

quently, women are less likely to take an action on paid digital ads, since they ignore social media ads more often than men do (Simmons Connect, 2013).

Finally, when referring to computer-related courses and masters, men and women also exhibit different behaviors. Women are usually less likely to be attracted to computer courses and computer-related careers, although this phenomenon is slowly changing (Li & Kirkup, 1993).

Despite the fact that women finish their university studies more than men (40 vs. 23%) in the OECD, only 5% of girls in the OECD are willing to study an engineering or computers degree, compared to 18% of male teenagers (Pisa in focus, 2014). In Spain, women represent the 59% of all university degrees, but only 21% of the total graduates in computer-related degrees are women. (Llaneras, 2015)

Consequently, and given the fact that social media is getting bigger with no signs of stop (Lahuerta-Otero & Cordero-Gutiérrez, 2016a, 2016b) the following case studies aim to determine if gender is a significant condition for users when reacting to social media advertising.

METHODOLOGY

With 1.04 billion daily active users, Facebook is the most used social network in the world. It accounts for the 23.39% of the worldwide traffic (Shareaholic, 2014) and every 60 seconds 510,000 comments are posted, 293,000 statuses are updated, and 136,000 photos are uploaded in this social network (The social skinny, 2012).

This research uses the case study method to analyze the results obtained by a research group from the University of Salamanca, Spain using Facebook ads platform to promote their activities.

This research presents the results of several advertising campaigns done by the research group across the year 2015. We have selected campaigns with different goals, according to the possibilities of Facebook Ads. Some of the campaigns want to increase the likes of the fan page, whereas

others want to increase traffic to the website of the research group. More specifically, ads intend to drive users to the website so students and prospective students could see the different master degrees and courses available.

These two different campaigns enables us to study specific aspects of social media advertising, as well as users' behavior in these media. First, we asked Facebook Ads to split the data by gender. Then, we statistically treated the reports in order to analyze the data. Finally, we divided the different performance metrics into three separate groups so the results could be useful for both academics and practitioners. The groups of metrics are:

- **Reach and Reaction:** This set of metrics represents the social and organic reach obtained in the campaigns, as well as the reactions obtained (actions and people who reacted to the ad).
- **Engagement:** These metrics refer to the performance of the ads on the different campaigns.
- **Cost:** The last group of metrics measures several advertising costs in order to reflect the investment alternatives of the university research center used in this case study.

RESULTS

This study presents the results obtained in several social media advertising campaigns from a research center group of the University of Salamanca (Spain) dedicated to teaching courses, degrees, masters and seminars in the computer and information technologies field. It is important to note that campaigns differ on their objectives, so there are remarkable differences that we need to consider when analyzing their performance.

Those campaigns whose primary goal is increasing the likes on a fan page require a greater engagement of the user, because they will receive regular information about the organization once they click on the like button. However, companies

where the objective is to increase website clicks imply a lower level of commitment, as users can control the actions they want to perform within the page and the content they decide to watch.

Once made this distinction, we will analyze the groups of metrics previously described in the methodology section.

With regard to reach and reaction metrics, we observe that likes campaigns get lower reach. This is because users need a stronger implication with the fan page as mentioned above. This means that organizations need a greater advertising effort (also in terms of budget, as like campaigns are usually more expensive on Facebook). It also means that results in terms of reach can be lower, compared to other campaigns with the similar budget but different objectives. As these characteristics of Facebook ads campaign can influence the chances of students' reactions, since the numbers will be lower in absolute terms, we will compare the results in relative terms.

About the first set of metrics, reach and reactions taken by users, we can see how women exhibit a larger number of reactions on likes campaigns (see Figures 1 and 2). Therefore, they interact more with the page, even though the initial ad reach is lower for this gender group. In relative terms, taking into account the number of people who react on each gender, 15.44% of women took an action when they saw the click on the website ad, compared to 14.17% of men. On the contrary, where the goal is to increase page likes, 3.08% of women interacted with the ad, compared to 3.15% of men. This may be due to the fact that men in general pay higher attention to technological content so they are willing to like the page in order to get the latest news and updates. However, women tend to use social media also with academic purposes, so ads become more relevant to them. We observe that, not only do women interact more with social ads, but they also tend to repeat more a specific action (54.89% of women vs 50.80% of men). As mentioned in the literature review, women need to be more confident about their actions in the digital world (they exhibit higher levels of

Figure 1. Reach and reaction (website clicks campaign)

Figure 2. Reach and reaction (likes campaign)

computer anxiety), so they click again to confirm the same information about the educational offers the research center shows in the ad.

With regard to engagement (Figures 3 and 4), we measure the number of clicks or results obtained related to the number of people reached or the number of times the ad was shown. We observe that the results are in line with what was mentioned before. Women exhibit greater engagement levels in clicking on an ad with academic content. These results are logical, since the feminine gender need to reflect more before taking a decision, especially if that implies high expenditures. Women click more in this type of ads to inform themselves and, even if the topic is not of initial relevance to them, this tendency is changing. On the contrary, where campaigns aim to increase fan page likes, ads are more efficient in men. This is because men tend to show higher interest on ICT and computer-related topics, as previously mentioned. We need to highlight an exception because, if we look at the proportion of results, women performed a larger number of actions compared to the times the ad was shown. This may be due to their curiosity in discovering the content of the ad, even though this fact does not turn into a likes increase.

Lastly, concerning cost, we can observe that there also exist gender differences. If ads try to drive traffic to the website, the cost of clicks is lower for women. We can also see how the cost of ads is less than a euro cent per click, so the campaigns perform effectively (see Figures 5 and 6). However, where the aim is to increase page likes, we observe that cost is sensibly lower for men. The results are consistent with all the results previously explained. In the end, a stronger reaction and higher ad efficiency imply lower costs. If we focus on the type of ad, website clicks campaigns are cheaper. This is due to the fact that like campaigns, as previously stated, require a stronger user commitment as already explained. This complex action requires an active user engagement, and consequently, a higher cost.

FUTURE RESEARCH DIRECTIONS

The present research suffers from several limitations we want to deal with in future studies. First, even if the quantitative results seem to indicate the campaign's differences across gender, they only refer to a single data source. Moreover, we cannot deny that many social network users are reluctant

Figure 3. Engagement (website clicks campaign)

Figure 4. Engagement (likes campaign)

to advertising, so they ignore the ads they are exposed to. Furthermore, this case study belongs to a research group from a public University with only two types of campaigns. Moreover, advertising campaigns were designed following certain age and location criteria (not in terms of gender) so these variables could also affect results. Lastly, the research group works with limited budget, which

could also constraint results. Future research will intend to enlarge the sample and perform several analyses on diverse teaching centers across time, to see which campaigns become more efficient in terms of gender. Additional research could also include alternative variables (such as gender, country of origin or field of studies) to test if differences across groups prevail.

Figure 6. Cost (likes campaign)

CONCLUSION

As we have seen, social networks and their development constitute a powerful and efficient advertising media. Previous studies have proved the efficacy of advertising in horizontal networks to promote academic-related content (Lahuerta-Otero and Cordero-Gutiérrez, 2016b). However, the present study goes a step further and tries to identify behavioral differences of users depending on gender.

The billions of daily active users engaged in social media constitute an excellent source of prospective students. Many organizations are already present in virtual environments so competition increases every day. Therefore, firms and brands need to find alternative, efficient ways to communicate with current and prospective students.

After analyzing gender differences, we can conclude that women and men process ads differently. This is also the tendency of the case study. After concluding the campaigns, a total of 88 people enrolled in the promoted masters, where 31.8% were women. On the fan page of the case

study, the proportion of women is bigger (45% of women compared to 54% men). We can observe that, even though women reacted more to ads, organizations need to make further efforts in order to convince them to enroll in computer-related superior studies.

Accordingly, based on their genetic and sociological differences, women need more time to process ad information. However, they exhibit a higher degree of engagement if the objective is to increase traffic to the website. They might need to click on the same ad several times, but they are willing to analyze the information as they can use it for their academic purposes. On the contrary, men are more straightforward and they prefer to like the page so they can receive news and information directly on their Facebook wall. Consequently, advertisers should customize ads depending on gender, as this will increase their effectiveness. Bearing in mind the restrictions of the Facebook Ads platform (number of characters on the title and text), organizations should focus on attracting men and women by using different, segmented campaigns.

KEY TERMS AND DEFINITIONS

Engagement: Refers to the acts of talking to, messaging or otherwise interacting with other people on social networks. This broad term encompasses a several different types of actions on social media, from commenting on Facebook posts to participating in Twitter chats (Hootsuite, 2016).

Result Rate: The number of results the ad received divided by the number of impressions.

Social Media Marketing: The use of social media by marketers to increase brand awareness, identify key audiences, generate leads, and build meaningful relationships with customers. Social media marketing should be well coordinated with social customer service, community management, and social selling activities to create seamless relationships with customers across their life cycle (Hootsuite, 2016).

Social Network: A service based on a web platform that allows people to create their one

public or semi-public profile within a limited system. It also allows the possibility of creating contact lists and visualizing the lists of other friends (Boyd & Ellison, 2007).

Social Reach: The number of people the ad was serve to with social information. For example: if three people see an ad two times each that says a friend likes your page, it counts as three social reaches.

Unique Clicks: The total number of unique people who have clicked on the ad. For example, if three people click on the same ad four times, it counts as three unique clicks.

Unique CTR: The number of people who clicked on the ad divided by the number of people you reached. For example, if you received twenty unique clicks and the ad was served to 1,000 unique people, your unique click-through-rate (CTR) would be 2%.

The Gender Dimension in Urban Air Quality

INTRODUCTION

In the light of several reports (IPCC, 2001; UNDP, 2007), it is evident that human contribution in global warming and climate change can be attributed differently between genders. Within the developed societies female's contribution tends to be less than male's on average, due to different social roles but also to different environmental consciousness and behaviour. E.g. women have different consumption habits (use of public transport, walking or cycling trips) and are more likely to support greenhouse gas emissions reduction policies related (support of recycling and energy efficiency initiatives). In Europe, direct and indirect energy consumption tends to be higher among male than female inhabitants a fact that is independent of income and age, approximately 39% higher in Germany and 22% higher in Sweden (genderSTE, 2014). Worldwide, it is declared that money paid to females is more mainly consumed on family needs, e.g. food and clothing, while money paid to males is more likely to be consumed on leisure, energy-intensive goods that cause high emissions. Thus, a greater proportion of an average man's carbon footprint is due to leisure than an average woman's (Druckman et al., 2012). Last but not least, women are more sensitive to extreme weather conditions, such as floods and heatwaves and more likely to experience fuel poverty due to income inequalities (Fouillet et al., 2007).

At the same time, the global economic system is male dominated and while women have an increasingly significant role in the economic system that led to global warming, they are underrepresented in the decision making, industries and organisations focused in the environmental (climate change, transport and energy) sector. Female often surpass the male participation in voluntary environmental campaigning actions, accounting for approximately two thirds in Europe (WEN, 2010). The average proportion of women in national ministries responsible for the environment, transport and energy, by level of authority in the EU-27 is extremely low, reaching the 25.6% in 2012 according to data generated from the European Institute for Gender Equality. The aim of the current study is to review the current conditions in Europe and Greece and identify the gaps, if any, of women's involvement in climate change and global warming decision making.

BACKGROUND

Gender Priorities in the European Union

Climate change affects both women's and men's living conditions, welfare and wellbeing, however due to gender roles, women do not affect the environment in the same way as men, and in many

countries women's access to resources, and hence their opportunities to manage conditions and adapt are quite limited.

At the same time, environmental policies are characterized by lack of sensitivity to women's different economic and social status and needs, having as a result women to be directly and disproportionately affected from environmental degradation. While consumption and lifestyle patterns still differ between two genders, with women to consume less and being more environmentally conscious, "women are clearly under-represented in environmental negotiations, budget deliberations and decisions on achieving a green, sustainable economy" (EC, 2012). According to 'Gender aspects of the economic downturn and financial crisis European Parliament resolution of 17 June 2010 on gender aspects of the economic downturn and financial crisis (2009/2204(INI))', the European Parliament "urges the need to encourage women in local entrepreneurial initiatives in green economy". The European Parliament (2012) resolution of 11 September 2012 'on the role of women in the green economy (2012/2035(INI))' "calls on the Commission and the Member State to introduce gender equality into all environmental policy areas" and introduce gender equality into all environmental policy areas, and at all levels of economic decision-making. On 14 November 2012 the European Commission published its proposal for a Gender Diversity Directive for improving gender balance on company boards, obliging companies with less than 40% of women non-executive directors to make significant efforts to make appointments in the next seven years to reach this target.

Furthermore, the Opinion of the European Economic and Social Committee on 'The gender dimension in the Europe 2020 Strategy' 2013/C 76/02 (EU Legislation, 2013), the Commission is "highlighting the essential role played by women in sustainable development, while "women can have a key influence on decision-making concerning the environment, particularly with regard to climate change policy. This is a new opportunity

for women, who can play a key role and improve their personal and financial situation by getting involved with the new and emerging green economy, which is a crucial sector for development and job creation". After all "women's activism was critical in getting the conversation started," according to historian David Stradling, author of "Smokestacks and Progressives: Environmentalists, Engineers and Air Quality in America, 1881-1951."

In response to these requirements a gender perspective is a critical assumption towards a sustainable environment and a green economy in terms of the ecosystem, consumption, food, growth, transport, energy and citizen welfare.

Gender Priorities in Greece

According to the National Strategic Reference Framework (NSRF) for 2014-2020, the main tools for the implementation of gender policy will be integration of equal opportunities between men and women in all institutions, policies and actions (gender mainstreaming) and the assumption of certain specific activities in the following areas:

- Equal participation women in the labor market,
- The participation of women outdoor activities aimed at local development,
- Promotion of inclusion of women, prevention and control of female poverty and all forms of gender-based violence,
- Mainstreaming of gender issues in social protection and health,
- Support family,
- Equal participation of women in public life and processes of political, technological, social and economic decisions
- Combat discrimination based on sex and gender stereotypes and
- The integration of gender equality in public policies, monitoring and evaluation.

However, the Greek Legislation does not include the gender perspective as a critical parameter

through its development and implementation and in many cases it is characterized as neutral or negative, according to a report by the General Secretariat for Gender Equality (2013). For example,

1. The Law 4067/2012 (OG A79/9-3-2012) the “New Construction Regulation” that includes a number of provisions on accessibility of buildings and built environment. Regarding the motivation for environmental enhancement and the improvement of quality of life in densely populated urban areas, which gender neutral with no comment on specific needs.
2. The master plan for urban planning and environmental protection of the greater Thessaloniki area (L. 1561/1985) refers to the daily needs of citizens ignoring the gender matters. Special requirements due to diverse living habits and routines as well as the different ways in which environment is perceived and used between men and women should be considered for the optimum urban planning and city upgrading.

The most recent L. 3653/2008 on Research and Technology establishes the minimum proportion of male/female participation in national committees of research and development, that is at least 1/3 of each gender, as long the candidates are equally qualified. However, in practise the rule rarely applies.

MAIN FOCUS OF THE ARTICLE

Gender, Air Quality, and Global Warming

Despite it is widely accepted that balanced participation of men and women in decision-making is a prerequisite for improving the operation of democracy and society, the ongoing under-representation of women in political and economic decision-making reflects a basic democratic deficit

in Europe and the broader international context. At the same time it is important to highlight that the female population is more vulnerable in effects of environmental degradation and poor air quality (UN, 2014).

There are several studies that prove that poor air pollution conditions can generate negative effects in the female population in both rural and urban sites (Xu, Hu, Ha, & Roth, 2013; Huisman et al., 2005; Oiamo & Luginaah, 2013; Künzli et al., 2010). The proportion of women and young children is mainly affected as these groups of population spend most of their time indoors where solid fuels, fire places and cooking stoves are in extensive use. According to WHO (2014), around 3 billion people cook and heat their homes using open fireplaces and stoves using various burning materials. These materials are not always the appropriate ones, causing the death of over 4 million people prematurely from illness due to the poor indoor air quality. The mortality of premature deaths among children under 5 attributed to household air pollution is also extremely high.

Additionally according to The European environment — state and outlook 2010 (EEA, 2010), vulnerable population groups (e.g. pregnant women) are more threatened by the bio-accumulation of organic persistent pollutants such as mercury. Chen et al. (2005) and Miller et al. (2007), the associations of PM_{2.5} and cardiovascular morbidity and mortality were greater in women above 60 and at the same time Xu et al. (2013) states that air pollution (referring to air pollutants such as NO₂, SO₂, PM_{2.5}, O₃ and CO) increases risk for hypertension in pregnant women during early pregnancy and the full gestational period.

Ambient air pollution has stronger effects on females partly due to autoimmune disorders. Females were more likely to report cardinal symptoms after controlling for income, age and chronic diseases (Oiamo & Luginaah, 2013). As Bakke et al. (2007) suggests female gender has reported health symptoms more often than did men and complained more about physical but not psychosocial factors gender, psychosocial,

and physical environment factors were related to symptoms and perceived indoor climate. Female gender seems to be highly associated with the sick building syndrome and the symptom of atopia (Magnavita, 2014).

Several studies have linked air pollution exposure to autism, including the Volk et al. (2011) study in *Environmental Health Perspectives* that looked at children in Los Angeles who lived near freeways and the Hallmayer et al. (2011) study that analysed traffic-related air pollution exposure data among pregnant women. The main conclusion of the studies was that a large proportion of the variance in liability can be explained by shared environmental factors in addition to moderate genetic heritability.

In general, studies suggest that health responses to air pollution may differ between women and men, however it is still unclear, whether observed modification is a result of sex-linked biological differences or gender differences in activity patterns or exposure measurement accuracy (Clougherty, 2010). Cautious consideration of gender effects and examination in environmental epidemiology may provide critical information on other social factors that can affect population response to air pollution.

In addition, in countries that face the severity of current financial crisis, structural changes occur in European members states as well, including migration and changing of household structures due to energy poverty. For example, in Greece, an exponential increase of wood and pellet employment is monitored primarily for heating purposes (Slini, Giama & Papadopoulos, 2014; Santamouris et al., 2013), posing major concern especially for women health (Figure 1), based on the results of a survey conducted in Northern Greece by the Department of Mechanical Engineering, Aristotle University of Thessaloniki (AUTH).

In Greece, due to the economic situation the consumption of oil products, which are the main fuel that is used by the household sector, decreased already by 25.7% between 2007 and 2010. What is impressive is the exponential increase in the

use of wood and pellets, a trend that has begun to have its first implications in matters of air quality, both indoor and outdoor, but also in an enhanced deforestation, with major field studies being currently carried out on those matters (Slini et al., 2014). Towards this direction many countries in Europe are adopting policies and effective precautionary measures in order to reduce the exposure of vulnerable population groups in toxic environments (EEA, 2015).

At the same time, research on gender-related disparities are mainly focused on energy consumption profiles and transport use. As pointed out at the Report on Gender Equality and Climate Change (EIGE, 2012a), the most significant gendered differences in energy consumption were monitored in Greece and Sweden, with men energy consumption reaching a proportion of 39% and 22% more than women, respectively. Moreover, it is suggested that women use the public transport or other sustainable means of travel more often than men.

Gender Balance in Environmental Decision Making

As global warming is a multi-fold issue and the abatement policy (e.g. GHG emissions, legislation, and limit values) requires an interdisciplinary approach conducted within environmental authorities. Thus, the gender distribution in authorities responsible for climate change adaptation/mitigation measures is substantial.

According to EU data, concerning environmental governing positions in European States, such as senior and junior ministers in environment, energy and transport at national governments, the women participation was slightly increased from 20% to 27% during the last three years (2012-14), a proportion that is still significantly lower than male proportion (Figure 2). In Greece during the same period there was no female representation.

However, the national administration positions show a slightly improved distribution with the female proportion increasing from 33% to

Figure 1. The average annual fuel and electricity consumption for the years 2011–2012 by type: (a) oil in litres, (b) natural gas in Nm³, (c) electricity in kilowatt-hours and (d) wood in kilograms

Figure 2. The proportion of men and women in environmental ministers (senior and junior) in European Member States for the period 2012–14

36% between 2012 and 2014. In Greece the data are considerably more balanced compared to the European figures, though decreased from 48% to 45% from 2012 to 2014 (Figure 3).

It is noteworthy to mention that in a broader approach the representation of women in boards of large listed companies is also discouraging,

with major gaps and little progress on women representation and career evolution, as presented in figure 4, in both the European Member States and Greece. More recently, and specifically in October 2014, Greece stands for the proportion of 8.9% of women in highly ranked position with a European average of 20.2% (EC, 2015).

Figure 3. The gender distribution of environmental national administrators (a) in the European Member States and (b) in Greece for the period 2012-14

Figure 4. Representation of women and men (absolute numbers) on boards of high listed companies (a) in the European Member States and (b) in Greece for the period 2003-2010

SOLUTIONS AND RECOMMENDATIONS

It is broadly acknowledged that there is still a gap in legislation providing for non-discrimination against women and gender equality in the areas of social security, education and employment (EU Legislation, 2016a). At the same time, the gender dimension has not been taken into consideration in the current and planned initiatives and policies aimed at exiting the crisis (EU Legislation, 2016b),

despite the fact that women play a critical role in driving economic development.

The analysis and evaluation of the current situation is reflected in the development of initiatives and the adoption of strategic plans at national or global levels that are mainly focused in gender mainstreaming in education and training, the labour market, the economic and political decision making. The promotion of women empowerment, the establishment of fair and transparent systems and mechanisms, the enhancement of social and

economic opportunities, the support of inclusive procedures and initiatives for both genders in all community levels and the promotion of reliable and gender-responsive institutions that will support inclusive, participatory and sustainable development processes can foster the positive dynamic of gender equality and balance.

Focusing in gender and the environment, a number of specific, good-practices as well as the development of partnership and collaboration between sustainable development actors and authorities can raise progressive synergy for analyzing the current gender-environment status and promoting novel strategies and operations.

Having the aforementioned facts under consideration, the European Commission has established a set of indicators in order to determine and evaluate the women's participation in decision making on climate change (EIGE, 2012b), that is the following:

- Proportion of women in climate change decision-making bodies at the national level in EU Member State
- Proportion of women in climate change decision-making bodies at the EU level
- Proportion of women in climate change decision-making bodies at the international level
- Proportion of women tertiary graduates of total graduates in natural sciences and technologies at the EU and Member State level.

At a global level, the development and collection of this kind of data will support the study of gender-climate change issues and may provide the benchmark for the development of new indicators about the correlation between gender, environment and social welfare and justice (UNFCCC, 2015). The establishment of “gendered” capacity building through education, training and mentoring programs and action should be at the top agenda of authorities and stakeholders, in order to ensure the women's engagement in technology and further in information science.

Thus, the issue of gender equality and women empowerment in all policy fields and sustainable development sections will enhance the growth potential of a balanced, fair society.

FUTURE RESEARCH DIRECTIONS

Aiming at the support of women, future research directions and solid steps include the development and adoption of strategies for integrating gender perspective into policy-making process, the awareness' raising initiatives concerning the significance of gender perspective in science and innovation. In this frame, the investment in equal representation can be achieved by the support of structural changes in education institutions, boards of directors and councils via processes that highlight the significance of gender analysis. Additional data, both qualitative and quantitative, thorough and systematic analysis and evaluation are required regarding the gender perspectives, not only in environment, climate change, global warming, between and across other research fields and disciplines and innovation. Gender equality and balance need also to be addressed when developing national strategies, institutional strategies, or international research initiatives.

Last but not least, fostering the society participation in gender issues can support the strengthen policy -oriented research on gender equality challenges, leading eventually in societal prosperity, poverty reduction and sustainable development.

CONCLUSION

The current study unveils the relations and links between gender and research and development in cross cutting issues of environmental engineering and science. It is proven that there are dissimilarities between males and females regarding environmental attitudes, contributions and capabilities of adaptation in the mitigation measures as well as the socio-economic impacts of climate change policies. As little progress is achieved, it comes

without saying that gender perspective is a critical assumption towards a sustainable environment, technology and a green economy in terms of the ecosystem, consumption, food, growth, transport, energy and citizen welfare. As the engendering of decision making on climate change will reinforce and will improve the efficiency of the suggested policies, the systematic research and monitoring of gender equality data and development of awareness initiatives are on the top of the agenda of policy recommendations. Quantitative targets and strong commitment on gender equality on science and technology by national governments, international institutes and authorities are critical areas of concern towards sustainable social development.

KEY TERMS AND DEFINITIONS

Air Pollution: The increased concentration of pollutants in the atmosphere with negative impacts in human health and the natural environment, which can be generated by both natural causes and human activities. The increased imbalance of harmful gases in the atmosphere can trigger the global warming.

Climate Change: The change of the long-term average weather conditions and broadly refers to changes in our planet, such as the rise of the sea levels, the shrinkage of mountain glaciers, the ice melt in the Arctic.

Gender Mainstreaming: The inclusion of the gender aspect in structure, policy and strategic planning of organisations, authorities and stakeholders, at all levels.

Global Warming: The rise of the average global temperature mainly compared to the pre-industrial era.

Energy Poverty: The limited access to energy services that is vital for society well-being and sustainable development.

Environmental Management: The management of the use and conservation of the environment, the natural resources, the protection of habitats and species and the control of hazards.

Women Empowerment: The reinforcement of the social, economic, political and legal involvement of women in the workplace, marketplace and community.

Gender Equality: The equal treatment between genders in legislation, in labour market, earnings, education, decision making.

G

How Exclusive Work Climates Create Barriers for Women in IS&T

Katelyn R. Reynoldson

Old Dominion University, USA

Debra A. Major

Old Dominion University, USA

INTRODUCTION

Organizational climate consists of employees' shared perceptions of rewarded, supported and expected behaviors as well as perceptions of organizational events, practices, policies, and procedures (Schneider, Wheeler, & Cox, 1992). Climate can have significant effects on employee job satisfaction, performance, work attitudes, and motivation (Parker et al., 2003). When an organization's climate is *inclusive*, organizational members feel equally welcomed, respected and valued. Moreover, employees may experience increases in job satisfaction and organizational and career commitment (Major & Morganson, 2009). *Exclusive climates* are linked with turnover, reduced organizational commitment, decreased job satisfaction (Major, Davis, Sanchez-Hucles, Germano, & Mann, 2006) and feelings of anxiety and emotional stress (Brimhall, Lizano, & Barak, 2014).

Unfortunately, women in information sciences and technology (IS&T) frequently experience exclusive work climates (Walton, Logel, Peach, Spencer, & Zanna, 2015). This is due, in part, to the underrepresentation of women in the field. Relative to men, fewer women enter higher education with a science, technology, engineering, or mathematics (STEM) major, while even fewer pursue STEM careers (Hughes, 2014). Currently, women comprise 26 percent of those employed in computer and mathematical occupations and only 27 percent of those employed as computer and information systems managers (United States

Department of Labor, 2014). This article details some of the barriers women encounter in an exclusive IS&T work climate, including stereotypes, stereotype threat, the motherhood penalty, work-family conflict, and lack of mentoring.

BACKGROUND

While women's participation rates in male dominated fields, such as medicine, law, or accounting, are increasing, women remain underrepresented in IS&T (Diekmann, Clark, Johnston, Brown, & Steinberg, 2011; Walton et al., 2015). This shortage of women is not unique to the United States; in fact, many countries around the world encounter a similar dearth (Jackson, Hillard, & Schneider, 2014). Furthermore, women tend to leave STEM fields for other professions at high rates (Glass, Sassler, Levitte, & Michelmore, 2013).

Women are significantly underrepresented in higher-level managerial roles in the industry (Servon & Visser, 2011; Wentling & Thomas, 2009), stemming from a '*glass ceiling*,' which women encounter when they have greater difficulty climbing the corporate ladder due to subtle barriers that are not as prevalent for men (Adya, 2008; Major & Morganson, 2009). Other barriers women may experience arise from the nature of IS&T work (i.e., long hours, travel, on-call status; Ahuja, 2002; Armstrong, Riemenschneider, Allen, & Reid, 2007) and the IST&T work climate (i.e., male dominated, exclusive; Wentling &

Thomas, 2009). The IS&T climate can be “chilly” for women as they can feel out of place and less compatible with the stereotypically masculine environment of the field (Blickenstaff, 2005). As part of the male dominated climate in IS&T, women may experience exclusion from informal networks within the field, which negatively affects work opportunities, such as job placement and advancement (Adya, 2008) and self-confidence (Wentling & Thomas, 2009).

STEREOTYPES

Gender stereotypes are characterized as either descriptive (i.e., beliefs about characteristics men and women *do* hold) or prescriptive (i.e., beliefs about characteristics men and women *should* hold; Heilman, 2012; Koch, D’Mello, & Schneider, 2014). Both types can incite discrimination against women in IS&T, although in different ways. *Descriptive gender stereotypes* may lead to discrimination against women in IS&T fields because of a perceived lack of fit between typically feminine characteristics that women do hold and the characteristics of a stereotypically masculine field. *Prescriptive gender stereotypes* may lead to discrimination against women in IS&T because working in a traditionally male field violates traditional feminine gender norms. Because of a perceived lack of fit, due in part to prescriptive gender stereotypes, women may be viewed as less competent than men in male dominated fields (Amanatullah & Tinsley, 2013; Ceci & Williams, 2007). When women assert their competence by exhibiting agentic characteristics, however, this may result in *backlash*, negative reactions elicited when gender norms are perceived to be violated (Amanatullah & Tinsley, 2013). If competency is explicitly established, women may still be seen as less likeable and more hostile than their male counterparts (Amanatullah & Tinsley, 2013; Ceci & Williams, 2007). Whereas women’s competence tends to be questioned, men’s competency is often taken for granted (Heilman, 2012; Koch, et al., 2014).

The IS&T field itself can serve as a barrier to women because of its social construction as a masculine environment, often characterized as anti-social, individualistic, and competitive (Wentling & Thomas, 2009). To the extent that women are stereotypically viewed as more communal (e.g., concerned for others, deferential, emotionally sensitive; Heilman, 2012), and IS&T is a masculine environment that seemingly requires agentic traits (e.g., achievement-orientation, autonomy, analytical; Heilman, 2012) to succeed, women are likely to be perceived as a ‘poor fit’. This supposed incompatibility often results in lowered expectations for women’s success as well as perceptions of non-conforming women as deviant and less likeable (Koch et al., 2014).

For women that do value communal goals, stereotypes that IS&T is adverse to collaboration and teamwork can lead to disinterest. Diekman et al. (2011) found that female interest in IS&T was bolstered when the field was portrayed as conducive to communal goals. In addition, the IS&T workspace can be off-putting for women when it emits cues of incompatibility with the field. For example, the presence of stereotypical computer science objects (e.g., Star Trek memorabilia, comics) in an IS&T workplace can create signals that reinforce women’s feelings of exclusion, whereas neutral decorations (e.g., nature posters, art) can help foster feelings of inclusion (Cheryan, Plaut, Davies, & Steele, 2009).

STEREOTYPE THREAT

Stereotypes are learned from a young age and are so ingrained in us that they can unconsciously affect an individual’s perceptions of others (Rudman & Phelan, 2015). Stereotypes can be positive (e.g., Asian individuals are better at math) or negative (e.g., women perform worse than men in mathematics; Ambady, Shih, Kim, & Pittinsky, 2001; Franceschini, Galli, Chiesi, & Primi, 2014). When a group is stereotyped to perform negatively in a certain situation, that group often exhibits less than optimal performance due to concerns of confirm-

ing said stereotype. This effect, known as *stereotype threat*, impairs performance because some of the cognitive resources used for performance are instead preoccupied with stress, monitoring performance, and regulating negative thoughts and behaviors (Appel, Kronberger, & Aronson, 2011). For example, women knowledgeable of the stereotype that men outperform women in math may succumb to stereotype threat and underperform on a given math test. Stereotype threat sometimes leads to disidentification from the stereotyped domain (Appel & Kronberger, 2012) suggesting that negative stereotypes relating to IS&T may lead women to leave the field entirely (Streets, Major, & Morganson, 2015). Stereotype threat can be activated explicitly (i.e., mentioning the stereotype before the test) or implicitly (i.e., ask the test taker to record their gender before the test).

Stereotype threat is a concern for women in IS&T because they are stereotypically viewed as less competent in the field, relative to men (Appel & Kronberger, 2012; Appel et al., 2011; Logel, Walton, Spencer, Iserman, von Hippel, & Bell, 2009). However, the presence of stereotypes does not affect all women the same way. Franceschini et al. (2014) found that women were more vulnerable to stereotype threat if they strongly associated men with mathematics. Subtle sexism can also elicit stereotype threat in women. Logel et al. (2009) suggested that people use interpersonal interactions as a way to determine how their social identities are viewed in a given context. In male dominated environments, women may pick up subtle hints that they are at risk of being seen through a negative gender stereotype, thus activating stereotype threat.

MOTHERHOOD PENALTY

Women are underrepresented in STEM but mothers are even more rare (Glass et al., 2013). Family obligations combined with maintaining a career in STEM can prove to be somewhat problematic for women. In fact, getting married while working

in STEM is negatively associated with retention, unless the significant other also holds a STEM position (Glass et al., 2013). Mothers in the workplace may experience various negative outcomes such as lowered perceptions of competence and commitment, workplace incivility, slower career advancement, and lower wages and is known as the motherhood penalty (Correll, Benard, & Paik, 2007). Correll et al. (2007) suggested that this penalty arises from perceived incompatibility between what cultural norms dictate as a mother's role and the ideal worker's role. Fathers do not experience the same perceptions of incompatibility between being a father and a worker (Correll et al., 2007; Heilman & Okimoto, 2008).

After becoming a mother, women are viewed as less competent but warmer, however, warmth is not a valued trait in the traditional IS&T workplace, and thus no benefits are reaped from this gain. On the contrary, men maintain high levels of perceived competence and are viewed as warmer when they become fathers (Cuddy, Fiske, & Glick, 2004). Moreover, mothers are rated as less committed to the workplace than childless women (Armstrong et al., 2007; Roldan, Soe, & Yakura, 2004) whereas fathers are viewed as more committed to paid work, relative to childless men. This is likely because mothers are still expected to take care of children and family matters more than men are (Ayre, Mills, & Gill, 2014; Berdahl & Moon, 2013; Ceci, Williams, & Barnett, 2009). Given that women are already viewed as less competent than men in the IS&T field, additional decreases in perceived competency as mothers can be especially harmful.

Miner, Pesonen, Smittick, Seigel, and Clark (2014) found that mothers experience *workplace incivility*, or low-intensity workplace behavior with ambiguous intent to be rude or discourteous that violates workplace norms of respect for others (i.e., condescending comments, exclusion from professional camaraderie). Specifically, they found that mothers of three or more children experienced more workplace incivility, relative to those with less than three children and childless

mothers. Miner et al. (2014) found that experiencing incivility was associated with decreased job satisfaction, increased turnover intentions, and increased depressive symptoms. However, Miner et al. (2014) found that childless women were more strongly affected by these negative outcomes than mothers, suggesting that children can actually help to mitigate the effects associated with incivility. This is especially germane to mothers in IS&T as Miner et al. (2014) assessed incivility experienced within a male dominated field.

Career advancement is also an issue for mothers in IS&T. Heilman and Okimoto (2008) found that when applying for the same high-level management position, mothers were less likely to be considered for advancement, relative to other male and female applicants. Cuddy et al. (2004) found that mothers are less likely to be hired, promoted, and educated further, relative to childless women. Correll et al. (2007) submitted real application materials to over 600 jobs, identifying equally qualified male and female applicants as a parent or childless. They found that childless women were twice as likely to get a call back, relative to mothers, while fathers experienced no such disadvantage. Even when mothers are hired, there is a larger wage gap between childless women and mothers, relative to the gap between men and women, with mothers earning the least (Crittendon, 2002). Childless women climb the corporate ladder at slower rates than men (Ceci & Williams, 2007) and it seems as though mothers tend to fall in their wake.

WORK-FAMILY CONFLICT

The nature of IS&T work, which is characterized by long hours, travel, on-call status, etc., can lead to work-family conflict for both mothers and fathers. Amstad and colleagues (2011) found work-family conflict to be negatively correlated with well-being (e.g., general stress, work-related stress, health problems) and job performance. Moreover,

work-family conflict can result in turnover (Ayre et al., 2014; Servon & Vissor, 2011). Given that women are often expected to be caretakers and family focused (Ayre et al., 2014; Berdahl & Moon, 2013), women may experience more conflict than men. Armstrong et al. (2007) suggest that women experience an increase in work-family conflict due to extreme job requirements, such as travel, which manifests as increased stress. Furthermore, some mothers may experience loss of respect and professional credibility if they are unable to uphold expectations of working long hours (Ayre et al., 2014).

Family-friendly provisions (i.e., flexitime, part-time employment, paid maternity leave) can prove beneficial for parents; however, utilization sometimes results in penalties such as reductions in status (Ayre et al., 2014) or perceptions of decreased job commitment (Glass et al., 2013). Mothers that accept part-time work may be penalized by not being considered for key roles, challenging work, and promotions (Ayre et al., 2014). However, there are signs that the landscape may be beginning to change for women in IS&T. Recently, Armstrong and Riemenschneider (2014) found that work-family conflict is becoming less of a barrier to the persistence of women in information technology (IT). They suggest this change may stem from the increasing availability of telecommuting as well as changing gender roles, such as fathers accepting more familial responsibilities.

LACK OF MENTORING

Mentoring occurs when an inexperienced employee receives professional and personal guidance from a seasoned employee to assist in advancing the protégé's career (Ghosh & Reio, 2013). It can prove beneficial for both parties through increased job satisfaction, organizational commitment, job performance, and career success for mentors (Ghosh & Reio, 2013) as well as increased job satisfaction (Underhill, 2006), job performance,

career advancement (Ghosh & Reio, 2013), and increased socialization (Adya, 2008) for protégés. Mentoring is prevalent in two forms: formal and informal. Formal mentoring occurs when the organization pairs a mentor with a protégé while informal mentoring arises when a mentor and protégé meet and naturally form a mentoring relationship. Research suggests that the latter process typically yields better outcomes (Eby, Allen, Evans, Ng, & DuBois, 2008; Underhill, 2006).

Although women in the IT profession value mentoring (Quesenberry & Trauth, 2012), they often lack mentoring opportunities (Adya, 2008; Wentling & Thomas, 2009). One reason for this is a limited number of women in the field to act as mentors, formally or informally (Diekmann et al., 2011; Walton et al., 2015), especially higher up the corporate ladder (Armstrong & Riemenschneider, 2014; Bilmoria, Lord, & Marinelli, 2014). Further, mentors tend to have a preference for same-sex protégés (Ahuja, 2002), which disadvantages women and makes it especially unlikely that they will develop informal mentoring relationships in IS&T. Major and Morganson (2009) suggest that both men and women may be reluctant to engage in a male-mentor/female-protégé relationship because, compared to same-sex mentoring pairs, there is a heightened probability that sexual insinuations will be made about the nature of the relationship.

FUTURE RESEARCH DIRECTIONS

Substantial research has documented the features of exclusive IS&T work climates and the disadvantages associated with them, especially for women. Future research should focus on discerning effective strategies for building inclusive IS&T climate. It is important to recognize that the aspects of the IS&T work climate that are most important and impactful may differ by gender. For instance, in a recent study Major, Morganson, and Bolen (2013) found that for women in

IS&T, family-friendly work practices and policies that emphasize opportunities for growth and professional development are most important in creating a sense of commitment to the IT field. However for men, experienced stress on the job had the greatest impact on commitment to the field. Additional research is needed to develop a better understanding of the most fruitful avenues for developing inclusive IS&T work climates across gender.

Future research is also needed to explore interventions for confronting the obstacles faced by women in exclusive climates. The most effective strategies are likely to be two-pronged in that they both equip women to deal with the obstacles they encounter and actively work to eliminate obstacles from the work environment. For instance, training to inoculate and prepare women for the stereotypes they may encounter could be coupled with diversity training aimed at confronting and eliminating such stereotypes. The ultimate goal is to create an inclusive climate that facilitates the satisfaction and performance of all members of the IS&T workplace.

CONCLUSION

Shapiro and Sax (2011) assert that the underrepresentation of women in STEM has economic consequences for women as well as our country. Building an inclusive IS&T climate (i.e., reducing stereotypical appearance of computer science work environment, implementing family-friendly policies) is a vital way to attract and retain women interested in the field to avoid said economic consequences. Building inclusion in the workplace is important given the benefits associated with inclusive work climates, such as increased job satisfaction and organizational and job commitment (Major & Morganson, 2009) and the positive outcomes of diversity, such as increased job satisfaction, feelings of inclusion, and creativity (Brimhall et al., 2014).

KEY TERMS AND DEFINITIONS

Backlash: Negative reaction against women whose behavior violates gender norms (Amanatullah & Tinsley, 2013).

Descriptive Gender Stereotypes: Beliefs about characteristics women *do* hold (i.e., women *are* nurturing and soft-spoken; Heilman, 2012).

Exclusive Climate: When organizational members do not feel equally welcome, respected and valued.

Glass Ceiling: Subtle barriers that exist to prevent women from rising to the top of the corporate ladder in the same way that men do.

Inclusive Climate: When organizational members feel equally welcome, respected and valued.

Prescriptive Gender Stereotypes: Beliefs about characteristics women *should* hold (i.e., women *should be* nurturing and soft-spoken; Heilman, 2012).

Stereotype Threat: When a negatively stereotyped group's performance is hindered due to concern of confirming that stereotype.

Workplace Incivility: Low-intensity workplace behavior with ambiguous intent to be rude

or discourteous that violates workplace norms of respect for others (i.e., condescending comments, exclusion from professional camaraderie; Miner et al., 2014).

Women and IT in Lilongwe

Alice Violet Nyamundundu
Skyway University, Malawi

INTRODUCTION

Africa is like one family on the issue of gender. Women are deemed inferior and men are labeled superior in all arenas including education, world of work and even in health.. Both parties have internalized their positions as ‘natural’. The mentality is rooted in the African culture and socialization. Some women and men are now accepting a ‘wake up call’ but at a very slow rate. Women in Lilongwe and Africa in general are lagging behind in IT and society in general. This paper focuses on gender as in ‘women’ since they are the most disadvantaged in IT. However, gender challenges can be overcome.

BACKGROUND

When the word gender is mentioned it seems to refer to women only simply because women are the most affected between the two. According to Unesco 2004 gender differences are ‘manmade differences’ and can change and vary from region to region. Both men and women are born with a ‘clean slate’ on the issues of gender; it is society which construct them. Sex is a ‘biological difference’ (Mbiti 1997). The physical differences are interpreted differently and at most to the disadvantage of the other. One’s sex at birth will either give power or poverty. According to the African culture, contrary to the western culture, the fact that one is born a boy means intelligence, IT skills, fame, riches and high positions. On the contrary, being born a girl means inferiority, submission, poverty, lack of IT skills and second class position. There is need for a powerful mental rewiring for women to be emancipated from this hard shell.

Conversely women on their part have internalized the inferiority complex to the extent of enduring abuses, protecting the abusers and dying under the hands of their abusers. According to Haralambos et al (2004) socialization is ‘the process of learning roles, norms and values appropriate to the people of that particular society’. The process enhances the inferior gender roles of women and the superior gender roles of men. If girls display the so called ‘masculine behavior’ they are discouraged. Social negative sanctions can be applied to them, sometimes as names for example ‘sissy’ for boys and ‘tomboys’ for girls (Haralambos et al 2004). This mentality discourages women to embark on acquiring IT skills.

In Africa and Asia, it seems being born a girl is a ‘curse’. Female sex is traditionally perceived as inferior to male sex. In Chinese families with a feudal tradition, girls are ranked as low as pigs and dogs (China’s Ministry of culture 1984, Unesco 2004). Since socialization is a strong process most girls end up lacking confidence in IT, fight for their rights or to better themselves.

In families, men become tough with their wives in marriage as tradition considers tenderness ‘unmasculine’ (Soetan 2001). Women are viewed as mothers and wives and not technical experts. Women are considered ‘stay at homes’ (Fields 2004) although sometimes educated. If men try to help their wives they are ridiculed by friends, relatives or even their parents. This African perspective has brought detrimental effects to women in Lilongwe in all areas including IT, education in general, world of work, politics and in families. All this is reflected in the Malawian society where legal marriage age of girls was only thirteen years until recently in 2015 when a bill was passed to push the legal age of majority to 18

DOI: 10.4018/978-1-5225-2255-3.ch296

years. The responsible authorities are now trying to review the marriage age of girls from thirteen years to eighteen years. They take Gandhi's view that 'men can never be a woman's equal in the spirit of selfless service with which nature has endowed her'(www.google). Globally, women should be viewed as hard workers who deserve to be rewarded and women should view themselves as such too. According to Schaefer (2010) "there are no innate or biologically determined gender roles for men and women," society constructs them hence it is the same society that can correct the anomalies to achieve gender balance in IT. Women need support to showcase their IT abilities (Sadc protocol 2013). Unless there is mental rewiring on both sexes, women will remain IT illiterate, poor, abused and in low and non profitable positions both in Lilongwe and Africa in general.

LITERATURE REVIEW

A lot of research has been carried out on the issue of gender and quite a number of publications have been produced (Unesco 2004, Beijing conference report 1995, Malawi Sadc Protocol 2013, Schaefer 2010, Torrington et al 2010). However, there seems to be a deficit of literature in terms of women and computer skills in Lilongwe. Women are still discriminated on the basis of sex and not abilities. Discrimination should be based on a 'fair criteria' and a 'level playing field' (Torrington et al 2010). Men and women should compete on equal terms in IT.

Women dominate low 'paying jobs' (Carroll et al 2009). They need to step up and go up the ladder. One way is by engaging in IT skills from infancy just like men. However this is restricted by socialization and culture which view "IT as complicated and not meant for women" yet both have the same capabilities. Women are only expected to use simple IT skills like messaging and what's up and not internet browsing or any technical IT skills. To date some still view women's oppression as inevitable (Sengupta 2004).

According to sociology discipline, functionalists maintain that gender differentiation has contributed to overall stability. Talcott Parsons and Bale (1950) were of the view that women should take the "emotionally supportive role and men the instrumental role" and the two should complement each other. On the contrary the two are conflicting. Men's instrumental roles are highly rewarded in terms of "money and prestige"(Schaefer 2010). Women's emotional support is highly abused. This imbalance has led to the imbalance in IT, education in general, and world of work and in politics. Women are stereotyped and viewed as robotic persons. This negative mentality has led to very few women in Malawi to advance professionally. About 20% of MPS and 26% of Top civil servants are women in the world (Human rights commission 2007). Literature is showing that something is being done to address the issue of gender in Africa but more effort is needed less women will continue to suffer. The mental gap should be closed first in order to completely close the IT gap.

Steps Taken to Close the Gender Gap

Quite a number of activities ranging from conferences to signing of documents have been done to address the gender imbalance but as mentioned in the literature review more is needed. In 2013 Malawi Sadc Protocol Barometer to address the gender gap was launched, that is applauded. In early 2014 the president of Kenya Uhuru Kenyatta signed into law the marriage bill which states that marriage partners have equal rights and obligations at the time of their marriage. Several policies have also been put in place for example the Zimbabwe gender policy 2013-2017 which advocates for equality between women and men in leadership positions, in business, education and all other sectors. In addition a woman's university was established in Zimbabwe, Marondera Suburb second to the Sudanese University for Muslim women(<http://www.arts.uwa.edu.au/>).

In Zimbabwe again the domestic bill was signed which also protects men and women from abuse.

Equal employment act was also introduced in many countries in Africa to cater for both sexes in recruitment and employment (Unesco 2004).

FACTORS INFLUENCING GENDER IMBALANCE

Educations

Although 90% of Africa have attained primary education very few proceeded to secondary education let alone tertiary education. Among those who do not proceed to secondary or tertiary education, women have the highest rate of dropouts. According to Afro barometer 2013, only 11% of women have post secondary school. Most parents probably from the age of 45 years and above were strongly nurtured in the African culture where the girl child is not respected. This has detrimental effects; the girl child can end up not respecting her education, herself and even drop out of school. As a result it is estimated that there are about 563 million women against 313million men who are illiterate in Africa (Unesco 2000).

Teachers themselves are playing a larger role in the lack of education of girls. Most teachers both male and female encourage the 'boy child' more than the 'girl child' because they were socialized as such themselves. This brings IT reluctance in women and girls to the extent of accepting inferior positions. Teachers are highly valued by students and viewed as noble. Hence if the 'noble ones' are portraying the idea of inferiority then the progress of the girl child education is hampered. Girls have reported that the "discrimination by teachers is blatant" (UNESCO 2004). Girls are discouraged from taking math's and science because they are considered 'virile' subjects (UNESCO 1997). Automatically girls feel unqualified for the so called 'masculine subjects' namely IT. Parents should begin to believe in their children's intellectual capacities.

In countries like Swaziland being married to a king is a 'fabulous thing' to most parents and not education. Gender imbalance in education in Africa is still an eyesore to the extent that the target pegged by United Nation of reaching gender parity by 2015 could not be attained. The disparities are still large!(SADC Protocol Malawi 2013).

Childcare

Less shared child care responsibilities in Africa results in imbalances between men and women. Women are at the receiving end of disadvantages. There is no equitable distribution of labour in homes. Most women think that it is their sole right and responsibility to look after children and homes. Therefore they do not bother themselves with IT skills.

Marriage

In Africa, many women enter into forced marriages or 'encouraged marriages'. Socialization makes most girls and most women not to think of self development but to think of their husbands or marriage per se! In Ivory Coast child marriages are rampant. Girls are given into marriage to men 3 times their age (Soetan 2001). The people in the community condone the practice. To them, clan relationships are strengthened and girls are protected from an immoral life. This mentality label girls and women as inferior, immoral and without technical knowhow. In Malawi statistics show fewer girls than boys (Nation 2014) reaching secondary school. Most of them rush for marriage just after primary education. This reflects the mindset of the girl child due to socialization. They rush for marriage before acquiring necessary IT skills to run businesses. The problem of forced marriages is also seen beyond Africa. In Pakistan, women do not have the freedom to marry for love. Their rights are abused. They are supposed to marry a man chosen by the family. If they deviate they die in 'honor killing'.(Nation 2014) Women are not robotic creatures who can be controlled by other

people. They need the freewill to make decisions in all sectors of life including IT.

Health

Men and women are not at par in terms of health in Africa. Women are most disadvantaged. In Zimbabwe for example Hiv prevalence is at 7.8% high in women compared to 3.6% of men (Zimbabwe Gender Policy 2013-2017). Women sometimes are not free to make decisions about their health or family planning. In some religions, children and women are dying because they are not allowed to seek medical treatment, on the contrary their spouse and leaders stealthily and quietly seek medical treatment. Women need permission from their husbands to go to hospital since they are the once with the financial muscle. This makes the “male factor very important” (Soetan 2001).

In Nigeria there is Hausa proverb that reflects the mindset of people on women. This proverb says that a “healthy girl belongs to a husband, a sick woman belongs to her parents” (Soetan 2001) justifying the neglect of women in issues of health. This ideology is rampant across Africa and it reflects the unfair treatment of women. Weak health contribute to poor education, there is no way a woman can venture into advanced IT studies whilst having poor health. Most of the women end up dropping out of school. So the issue of gender imbalance and gender bias still needs to be addressed to a larger extent.

Role Models

Africa let alone Malawi lack role models especially in IT. Children learn fast when they have someone to imitate, the same applies to girls and women. They need someone they would look up to, a model who can motivate them to excel. In Africa such female people are scarce!

Stereotypes

African women are stereotyped by the society as people who always need male support and leader-

ship. Sex stereotyping persists in many forms and in all countries regardless of the level of development (Michel 1985). Basically women are trained in how to prepare food, how to behave towards men and how to look after children (Mbiti 1997). This constant portrayal of women and men occupying certain roles according to socially constructed gender division of labour (Zimbabwe Gender policy 2013-2017) is hampering the progress in closing the gender gap in IT studies. In the world of work, women are viewed as people who should be committed to their families and not technical jobs. This type of thinking has land women in inferior positions. They are viewed as “flowers of the world” (UNESCO 2001). To African society they can only flourish in the home and make their families happy yet women can be excellent engineers, architects, IT specialists, doctors the list is endless! As men can be excellent child minders, women can also be excellent managers and IT specialists in corporate organizations.

METHODOLOGY

For this qualitative document analysis research, I used the content analysis and the rubrics analysis approaches to identify themes and classify information from the documents. To achieve this, I consulted several documents in order to ensure trustworthiness of the findings. In addition to the document research, a 10 questions questionnaire was distributed to 20 female students at Skyway University in Lilongwe Malawi. This was done to affirm the real situation of women and IT at the moment even in higher levels of education.

FINDINGS

Both women and men do not encourage women leadership in politics. This was seen in Malawi Presidential elections 2014. Both women and men were castigating women leadership and were voting against the woman president. Women are stereotyped as poor leaders regardless of their

intellectual capacities and honest. On the contrary men are preferred on leadership regardless of their iron fists in ruling and several acts of corruption.

Socialization mostly by parents is leading to women oppression, abuse and stereotypes. Very few women proceed to secondary school for example in Malawi 50% of primary school children are girls but only 45% reach secondary school whilst only 40% reach tertiary education(SADC 2013, Gender Protocol Barometer). The reasons for drop out are certified as early marriages, arranged or forced marriages, poverty, distance to school, priority of boys over girls, socialization in general, lack of role models and stereotyping.

In Pakistan a woman was stoned to death in a so called “honor killing”(The Nation Malawi 2014) because she married a man of her choice. All this illustrating the harsh realities faced by women across the globe.

In this 21st century men are still shunning child care and view it as a ‘woman’s job’. In Africa may be only 2% of men will take child care responsibility let alone paternity leave. A man is ridiculed by peers, relatives and parents for cleaning after the child. The myth is, if a man does such things he is ‘bewitched by his wife’. Fear of ridicule and victimization prevent most men from helping in child care and domestic responsibilities. IT is considered a ‘masculine profession’ therefore most women shun it. Men need to be ‘man enough’ and take care of children and domestic responsibilities in order to relieve their wives. This will help women to find more time to advance themselves in technical professions such as IT.

Some laws in Africa are still discriminating against women leadership as seen in the Lesotho law of chieftaincy. A woman was denied the right to her father’s inheritance in chieftainship both by society and the law due to the fact that she is a woman. This intimidates other women and instill low self esteem in them so much that they confine themselves to the so called “women jobs and businesses”. There by keeping the IT gender gap wide.

According to Torrington et al (2010) women are beginning to enter some previously male dominated occupations but there remains a high degree of “subtle discrimination.” Women are still dominating low paying jobs for example care work(Carroll et al 2009) and the number of women as leaders is still pathetic!

According to the Equality and Human Rights Commission Report (2007), 20% of MPs and 26% of top civil servants are women and pay differentials between men and women have increased. The research has also discovered that there are no innate biologically determined gender roles for men and women. Both of them can be socialized to do any of the so called ‘masculine’ or ‘feminine jobs’. This can be revealed by a United States example where more women than men earned doctoral degrees (Bureau of the census 2008). Therefore women can also be managers, IT specialists, political leaders and supervisors respectively.

I also discovered that the treatment of girls across Africa and worldwide intimidate them and give them a low self esteem, for example the abduction of 200 girls in Nigeria in March 2014 by the organization called Boko Haram and the threat to sell them for prostitution instill fear in them. The girls would wonder “what the future hold for them, would they ever have the opportunity to become educated professionals”(2004).

According to United Nations(2001) women can be dismissed from the job or denied employment because they are pregnant. This treatment can be effected by other women or by men. There is stigma attached with pregnancy. Society view pregnant women as non performers.

In Malawi three quarters of girls who go to primary school do not proceed to secondary schools they drop out either to get married or to work as housemaids or start small fatcook¹(makandase) businesses which do not prosper at all. Therefore, IT becomes a night mare to them.

Below are the questions asked to 20 respondents at Skyway University and the responses given?

Table 1 shows the ages of the respondents at Skyway University. 95% of the female students

Table 1. Age

AGE	FREQUENCY	PERCENTAGE
18-24	19	95%
25-30	1	5%
31-40	-	0%
41-50	-	0%
Over 50	-	0%
Total	20	100%

asked are within the range of 18-24 years of age. These are the very people who are supposed to be more involved in IT issues since they are in a tertiary institution and that is why the researcher concentrated on this age.

Table 2 highlights the programs being undertaken by the respondents. 75% of the respondents are female students doing diplomas, whereas 25% of the students are doing Degrees. This information reveals that very few females continue with tertiary education to the upper levels that is degree level.

The research shows that 90% of the students use IT equipment for different activities. The below tables will clarify which ones and for what activities.

Table 4 shows the number of IT gadgets which are at women's disposal. As shown in the table

Table 3. Do you make use of any IT equipment?

RESPONSE	FREQUENCY	PERCENTAGE
Yes	18	90%
No	2	10%
Total	20%	100%

Table 4. Which IT equipment do you use?

EQUIPMENT	FREQUENCY	PERCENTAGE
Cell phones	18	90%
Tablets	1	5%
Laptops	3	15%
Desktops	1	5%
other	0	0%

Table 2. The programs in which the respondents are involved in

PROGRAM	FREQUENCY	PERCENTAGE
Degree	15	75%
Diploma	5	25%
Total	20	100%

4 90% have cell phones of different models and they use them to perform different tasks. 5% use tablets which is a more advanced technology than cell phones, 15% use laptops which is a much higher percentage than that of tablets. Another 5% use Desktops and no other technological gadget is used by the students except those mentioned above. This shows women are still lagging behind in technology.

Table 5 above shows that most of the girls use the social media at most and less on academic issues. The percentages are high on what's up and face book and lower on internet browsing which is shown by the 30% only. That makes one wonder whether students are aware of their technology in detail. Moreover Skyway University as an institution of higher learning, I expected to see internet browsing at a higher rate due to a lot of research needed at this level. However the reverse is true. 0% use twitter and the researcher assume that this is due to lack of IT skills.

Table 6 shows where women put much of their concentration, that is on what's up, where most gossips take place and issues of less importance take place. This fulfills what is mentioned by Bray (2007) that "men actively engage with machines,

Table 5. What do you mainly access when using these equipments?

FACILITIES	FREQUENCY	PERCENTAGE
Face book	7	35%
What's up	13	65%
Twitter	0	0%
Internet Browsing	6	30%
Other	0	0%

Table 6. how often do you access the previous mentioned facilities?

TIME PERIOD	FREQUENCY	PERCENTAGE	FACILITIES
Once a week	1	5%	Internet browsing
Everyday	14	70%	what's up
Twice a week	3	15%	Face book
Once a month	2	10%	Face book
Very rarely	3	15%	Internet browsing

making, using and loving them, women may have to use machines in the work place or in the home but they neither love nor seek to understand them. However this research is there to encourage women and girls in engaging in serious IT issues which allows them to research widely and get acquainted with the global world.

According to Table 7, three quarters of the student's skills ranges from good to excellent which shows that women are capable of venturing into IT issues even becoming IT experts. However, they do not give themselves time to get involved with IT equipment since they consider it a masculine profession.

Table 8 reveals that most students at tertiary level have received training of some sought and only a few do not manage to get the training. This shows that women and girls need to be assisted a lot in changing their mindset about IT. They should refrain from thinking that is a man's area.

Table 9 show that most of the girls did not receive formal training. 55% of the girls learned

Table 8. Did you receive any training?

RESPONSE	FREQUENCY	PERCENTAGE
Yes	17	85%
No	3	15%
Total	20	100%

Table 7. What is the level of your skills?

LEVEL OF SKILLS	FREQUENCY	PERCENTAGE
Poor	2	10%
Good	3	15%
Better	13	65%
Excellent	2	10%

IT skills from friends, 40% from college and only 10% from home. This leaves a lot to be desired. Not getting formal training can paralyze the performance of girls in IT. They lose self confidence when they face challenging tasks and it leads to low self esteem. This also assist in explaining why very few girls are engaged in internet browsing. Therefore their research will not be comprehensive due to lack of IT skills.

Table 10 shows that most women and girls view culture as their drawback. 80% agree that culture is blocking their way to technology. Most households care less on girls' technical skills than boy's technical skills. Their belief is that girls will get married and will be supported by their husbands therefore to them there is no need to equip them with IT skills. Some of the girls also do not make an effort when they get the chance

Table 9. Where did you get the training from?

PLACE	FREQUENCY	PERCENTAGE
Friends	11	55%
Office	-	0%
Home	2	10%
College	8	40%

Table 10. Do you believe that culture contributed to some of the challenges faced by women in IT?

RESPONSE	FREQUENCY	PERCENTAGE
Yes	16	80%
No	4	20%
Total	20	100%

due to socialization; they consider IT as men's job. Although gender empowerment is encouraged in the contemporary world, most households in Malawi are still clinging to the traditional culture which looks down upon women. This leads to many girls becoming IT illiterate. Three quarters of the population in Malawi stays in the villages and only a quarter in urban areas. This alone hampers progress of girls in acquiring IT skills.

CONCLUSION

By and large, women and gender in Africa is a cause for concern. The discussion has shown that society is contributing to a large extent to the gender gap in IT. Due to socialization girls grow with an inferiority complex and boys with a superiority complex. Being deemed inferior by society does not take away women's intelligence. Women can also be IT specialists, managers, engineers, doctors, pilots, architects and the like. Conversely, the women are internalizing the oppression and suppression due to socialization. They accept inferior positions and do not aspire for IT positions.

FUTURE RESEARCH DIRECTIONS

Gender awareness programs should be showcased to community through dramas, meetings and posters. Gender education can be delivered to parents and children in the community through media and gender educators. Media should play a vital role in applauding women's talents and their capabilities than stereotyping them. Parents should desist from socializing their children differently whether with their language, the things they buy for them, the schools they sent them to, the skills they train them into. More policies against sex, gender discrimination should be put in place.

Government of Malawi is also encouraged to make it possible for the girls both in villages

and urban areas to take up IT subjects in schools especially from primary schools. They can seek donor funding to provide electricity and IT gadgets in schools or even starting resource centers to help both boys and girls to learn IT from infancy. If this happens then it will be possible for Norris (2016) suggestion that "colleges should be equipped with innovative teaching pedagogy and new frameworks for quality online programs" to be designed and used by colleges and universities in Malawi.

Africa should organize its own conferences on gender and set its goals to close the gender gap. A lot of publicity on the advantages of gender equality should be done. Awareness should be at societal disposal showcasing why it is at its best interests to empower women and girls.

The curriculum in schools from infants should include gender and IT lessons. Schools should be encouraged to conduct gender workshops to help the girl child to have self esteem and aspire high. Gender sensitive curriculum should be put in place.

KEY TERMS AND DEFINITIONS

Corporate Organizations: Large organizations with a surmountable number of employees.

Discrimination: Unfair treatment.

Gender Empowerment: More consideration and support given to a particular sex.

Gender Equality: Same treatment of women and men.

Gender Oppression: Denial in terms of privileges and advancement to a certain group of people.

Gender Sensitive: Awareness in terms of interests of both sexes.

Gender: Socially constructed roles.

Gender Stereotype: Portrayal of women and men as occupying certain positions in society.

Socialization: Upbringing instructions, norms and values from society.

Geographic Information Systems

Application of Geospatial Mashups in Web GIS for Tourism Development

Somnath Chaudhuri

Maldives National University, Maldives

Nilanjan Ray

Adamas University, India

INTRODUCTION

Tourism is defined by the World Tourism Organisation (NSCB, 2004), as the act travelling for the purpose of recreation and the provision of services for this act. Currently, tourism industry is one of the fastest growing industries all over the world. This smokeless industry is basically a kind of service industry, as it renders service to the tourists and all other supporting industries related to tourism like, hotel industry, transport industry etc. This business involves many socio-economic activities like promotion and advertising tourist spots and destinations, providing effective transport facility, fooding-lodging, entertainment etc. At the same time when the tourism industry is flourishing it helps in socio-economic development of those tourist destinations. It also helps in strengthening the economical status of the country by earning foreign currencies without exporting national wealth. So, it is obvious that if this industry becomes more effective and efficient, it will definitely be the major source of revenue and will take a leading role in the overall economic development of the nation. Information and Communication Technology (ICT) can lead tourism to emerge as a new mantra for alternative economic development (Buhalis, 1998). Information Technology breaks the geographical boundaries so it is shared to the global audiences. Information Technology integrates between tourism product and requirement of the tourists. Due to changes in tourists or visitors behavior, the tourism market

is becoming more segmented with each potential tourist belonging to a number of market segments (Cheng et al., 2002). Tourist operators need to be aware of these changes and be equipped to respond or better still, take a proactive approach. Technological revolution during 1990s brought with it new opportunities and challenges for the tourism industries. Technology has become fundamental to the ability of the global tourism industry to operate effectively and competitively. Information technology is being rapidly diffused throughout the tourism industry and that no player will escape from information technologies impacts. These technological innovations started in the 1970s when the main airlines set up CRSs (Computerized Reservation Systems), with the strategic aim of building a global distribution network for their products. Connecting travel agencies to the CRSs set off a process of distribution automation involving an ever-increasing number of tour operators, carriers, and car hire firms, individual hotels, hotel chains, and other hospitality firms. Geographical Information System, an ICT tool has been extensively used for tourism promotion and management. It was in use for GIS data design and collection, database design management and application of tourism analysis and problem solving. Currently, Internet has become the inseparable part of the Information and communication Technology. Online technologies within the tourism industry have significantly impacted on communications, transactions and relationships between the various industry operators and with

DOI: 10.4018/978-1-5225-2255-3.ch297

the customer, as well as between regulators and operators. The Internet provides many advantages in the tourism industry (Ray et al., 2014). The GIS technicians and researchers started research on how to share the GIS features online, rather than using it as a standalone system. In the year 1993, the Web GIS started evolving rapidly. The online static maps slowly changed to interactive dynamic maps over the World Wide Web. This is the first step of Web GIS. The greatest advantage was to get rid of traditional desktop GIS, its installation and data sharing hazard. Today's web user can create content on the web both collaboratively and individually, allowing for a personalized web experience through wikis, blogs, podcasts, photo sharing, and other technologies. GIS and mapping applications have both benefited from and contributed to these trends, collectively called "Web 2.0" (Pierce et al., 2009). This provides the concept of Geospatial Mashups, especially Map Mashups. The latest trend in the field of geospatial science and technology in Web GIS, is *Geospatial Mashups*. Integration of multiple data layers from multiple sources, is one of the most common and effective functional requirements of Web GIS applications. On the Web GIS context, a Mashup is the process of merging multiple sources of data, both spatial and non-spatial, into a single integrated spatial display. It is about extracting spatial data from a non-spatial source and combining with other spatial data and finally displaying it on a map. This research paper discusses the basic architecture of the Geospatial Mashups in Web GIS and its application in visual impact analysis and strategic management in tourism.

Objectives of the Study

This present study seeks to the application of Web-Based Geographical Information System (GIS), an ICT tool for tourism management and promotion particularly through internet, with a future plan to develop this type of promotion by implementing GIS tools for tourism. In the context of tourism management this present study penetrates the

usage of Geospatial Mashups, a spatial technical tool of Web GIS. It disseminates maximum level of information for tourism promotion in a collaborative manner. This paper examines current development in Web GIS with the implementation of Geospatial Mashup technologies, such as Google Map in the context of map Mashups, and presents a classification of map Mashups and their application in tourism management and promotion. Geospatial Mashup has great potential to facilitate and widen the rapid development of the future web mapping technology in Web GIS in the context of tourism development.

Background and Literature Survey

Geographic Information System is one of the most popular ICT tools for capturing, storing, retrieving, manipulating, mapping and analyzing spatial and non-spatial geographical data in the digital format. GIS is the information system that provides functions including visual 3D presentations about any geographical locations, advanced analysis of digital geospatial information by processing them in an integrated manner.

GIS technology integrates common database operations, such as storage of data, retrieval through query and converting those data to information through statistical analysis (see Table 1). GIS manages region-based information and provides tools for depiction and analysis of various statistics, including population density, economic development, transport facility, types of vegetation etc. GIS helps us to store the detailed information of any region in the databases and maps to create dynamic displays. Additionally, it provides tools to convert and display raw data in the form of 3D maps, run any query, and overlay those databases in ways which is not possible with traditional spreadsheets. These special-efficient as well as effective abilities distinguish GIS from other information systems, and make it one of the most effective ICT tool to a wide range of public and private enterprises for elucidation of events, predicting outcomes, and scheduling

strategies. The United States Geological Survey (USGS) defined “GIS as a computer hardware and software system designed to collect, manage, analyze and display geographically (spatially) referenced data”.

If we want to define GIS covering all its features then it can be categorised as shown in Table 1.

Basically, it can be stated that GIS can use any information that includes location or region. Now, the location of a particular region can be expressed in various manner. It can be done through address, pin code, latitude-longitude etc. GIS can store, compare and analyse different types of information. The system can include information about the land, such as the location of water bodies, different varieties of vegetation, different kinds of soil, contours, transport facilities like roads, railway tracks, subways etc. It can include data about the density of population, economic standard, education level etc. GIS can also include information about the different buildings in the region like sites of factories, farms, and schools, roads, and electric power lines. Now days the GPS provide the satellite images of the shopping malls, cinema halls, hotels, restaurants, banks and even small retail stores also.

Now the question is, how this vast information is stored in this system. Actually, GIS can store data, not the information. Data is stored in the system and it is retrieved and analysed to convert it into relevant information. Data in different forms

and formats can be entered into GIS. Putting information into GIS is called data capture. GIS being a digital system can capture the digital data directly. Data that are already in digital form, such as images taken by satellites and most tables, can simply be uploaded into GIS. An example of this kind is data collected by satellites that show land use—the location of farms, towns, or forests. GIS can also include data in table form, such as population information. But any other non-digital or analog data should be digitised and then punched into GIS database; viz.

Maps must be scanned or converted into digital data. While punching the data in the database, GIS must make the information from all the various maps and resources align, so that they fit together. This is one of the most vital steps of data storage, this is necessary as the maps collected from different sources may be of different scales. A scale is the virtual relationship between the distance on a map and the real distance on the Earth. GIS integrates all the information from different sources in such a way that it will have all the same scale and no ambiguity during analysis. GIS technology allows all these different types of information, no matter their source or original format, to be overlaid on top of one another on a single map. This map or sometimes statistical reports or virtual models are generated as outputs just on a single click of the mouse of the users’ computer. The complete process of GIS function is depicted in Figure 1.

Table 1. Features and analytical functions of GIS

Features of GIS	Related Definition	Related Analytical Functions
A Process	A system for capturing, storing, checking, manipulating, analyzing and displaying data which are spatially referenced to the earth (DoE, 197: 132)	Presentation and thematic mapping Data Query Spatial Query Database
A Toolbox	Containing tools for collecting, storing, retrieving, transforming and displaying spatial data (Burrough, 1986: 6)	Integration Route finding
A Database	Of spatially referenced entities (Smith et al., 1987)	Point in polygon analysis Overlays
An Application	Cadastral information system, marketing information system, planning information system, etc.	Buffering Visualization and 3D modelling
A Decision Support System	Integrating spatial data within a problem solving environment (Cowem, 1988)	

Source: Bahaire and White (1999, p. 161)

Figure 1. Functionalities of GIS

From the basic features we can redefine GIS as:

- **Geographical**
 - It contains data and concepts which are concerned with spatial distributions and inventory mapping
- **Information**
 - It implies some notion of storage, retrieval and analyses of data, usually as an aid to decision-making.
- **System**
 - It involves the sequence of inputs, processes and outputs (Chaudhuri et al., 2015).

Tourism Classification and Problems

Tourism is viewed as travel for recreation, pleasure or instruction, often in organized groups. It could be visits to attractions, city breaks, and trips for business meetings, sports events, concerts or visits to friends and relatives. Tourism is becoming an integral part of our lives and culture (Balogun et al., 2010). According to Ayeni (2004) tourism can be categorized as follows:

- **Cultural Tourism**
 - It includes religious and national festivals, art galleries, historical monuments, arts and crafts, museum etc.

- **Ecological Tourism**
 - It includes geomorphological, geophysical and geological objects like waterfalls, mountains, sea-beach, desert, national parks etc.
- **Modern Tourism**
 - It includes modern notable engineering structures or architecture, amusement parks, travel and accommodation facilities.

The tourists get information about the popular tourist sites and then travel in search of cultural, ecological or modern tourism aspect. There are many locations or even countries which are sated with numerous ecologically or culturally attractive and significant tourist sites. But many of those locations are barely explored. Fajuyigbe and Balogun (2007) itemized those problems as follows:

- It is a time consuming, hectic and expensive work to updating existing graphical tourist guides and maps.
- Lack of digital online information for tourism amenities and destinations. There is hardly any comprehensive information over the internet.
- Inadequate technology-driven approach for sustainable tourism
- Lack of motivation for strategic marketing techniques and management

All the tourists are not tech-savvy to install a standalone GIS application in their individual computer system and do research about the tourist spots. Rather, it will be much simple if they can collect information over the internet. That leads towards the transition from GIS to Web GIS.

Tourism Using Web-Enabled GIS

Internet has become an inseparable part of the Information and communication Technology. The GIS technicians and researchers started research on how to share the GIS features online, rather than using it as a standalone system. In the year 1993, “Web 2.0”, the Web GIS started evolving rapidly. The online static maps slowly changed to interactive dynamic maps over the World Wide Web and Internet. This is the first step of Web GIS. The greatest advantage was to get rid of traditional desktop GIS, its installation and data sharing hazard. Web GIS is any Geographic Information System that uses Web technologies. In a narrower definition, Web GIS is any GIS that uses Web technology to communicate between two components (Fu et al., 2011). Traditionally, geographic information systems were realized as monolithic and platform-dependent applications (Wong et al., 2002). The major concern is to use GIS as a tool for communication between different interest groups like planners, decision makers, and the public. The rapid growth of the internet provides highly customized, accessible and interactive source of public information and is changing the ways that people capture and manipulate spatial information (Balogun et al., 2010). In 2004, Information Technology Planning Management and Development of Goa, India was developed by Dr. P. K. Pandley and Ruma Chakraborty to advice the Government in developing and managing tourism in Goa (Pandey et al., 2004). Ghana Geographical Information System (GGIS) was developed by Longmatey et al. (2002). It provides GIS in tourism management, marketing and promotion in Ghana. It is one of the principal GIT tool in Ghana tourism market.

Fajuyigbe et al. (2007) developed a web-enabled GIS for the management of tourism in Oyo state, Nigeria. The basic architecture of this application has two sections,

- Server-end and
- Client-end.

The client can access the geospatial information over the internet and the server will process and customize the query for execution. But it doesn't incorporate the Virtual tourism features. An implementation of Web-enabled GIS as a potential tool in sustainable tourism in western Nigeria was done by Fajuyigbe and Balogun (2007). This was an advanced version of Fajuyigbe et al. (2007)'s system. It was used as a potential tool for projecting data and analysis of critical information for the efficient management and promotion of tourism in most of the states in western Nigeria. Having reviewed the above cited works the requirement for integration of multiple datasets from different independent sources in Web GIS applications, has become prominent and inevitable.

Web GIS Architecture

The “Web GIS” became a synonym for Web information systems that provides a functionality of geographic information systems on the Web through HTTP and HTML (Shanzhen et al., 2001).

The simplest architecture of Web GIS should have at least two components, a Web-application Server and one or more Clients. Client can be as simple as a Web browser or a mobile client. The GIS service providing server can be connected by the client using Internet (HTTP). This dynamic connection is interactive in nature. The basic architecture is represented as in Figure 2.

The simple client side architecture allows the users to carry out some data manipulation, data customization and analysis locally on their own machines. The greatest advantage of this model is its low overhead on the server and high interactivity at the client side. Most of the computing

Figure 2. Basic Architecture of Web GIS

tasks are performed by the client end, as a result, less workload and computation on the server side. With direct access to the database, the capability if client computer can be maximized to match the traditional client/server application and reserves the platform-dependent characteristics at client side concurrently (Ben et al., 1999). On the other side the server side architecture allows clients to submit query for data and analysis to a server. The server executes the query, retrieve the result from the database and process the result. The spatial and tabular data remain on the server. This architecture provides cross-platform capability at the client side. No special plug-in or application software is required for this interactive full-duplex communication. But though the architecture is providing a two-way communication without installing any third party application software, it has a severe drawback in terms of its speed. It is slow because each time a request is made, a new HTML document containing a graph, or map has to be generated and transferred to the client end. The next section will explain how Web GIS works as a web application over the internet. The working principal of Web GIS is basically a query request and response cycle. Suppose the client is accessing the GIS application over the internet using any web browser or from a mobile application. The client is searching for a specific location. The client posts the query in the application or in the browser interface. The Web Server will receive the

query. In the next step the request will be forwarded from the Web Server to the GIS Server. The query will be executed by the GIS Server and required data will be retrieved from the GIS database. The result can be a simple map or, a satellite image or, a Mashup map, which depends upon the request from the client. The result is then forwarded to that Web Server from where the GIS Server has received the query and finally forwarded to the client. The browser interface or the mobile application will display the result. Based upon the data processing in the Web GIS application the complete workflow has been categorized into three sections, namely (Figure 3):

- Presentation tier,
- Logical tier and
- Data tier.

This complete Web GIS workflow is depicted as follows (see Figure 3).

The Presentation tier is the Web browser interface or the mobile application interface from where the client can send a request. Using the same interface the client can view the result. The web server will display the customized result in the presentation tier in the form of graph or, chart or, may be tabular data. Web server forwards the request query to the GIS server in the Logical tier. The key processing of the request and the query analysis is performed in this tier. SQL query is

Figure 3. Web GIS Workflow

executed by the GIS server and it retrieves the data from the GIS database. After the query is executed the result is forwarded from the GIS server to the Web server. The principal role of the Data tier is to maintain normalised data for effective query processing.

Geospatial Mashups

The three tier Web GIS system is definitely an easier and user-friendly application to get access to geospatial data over the internet just on a click. But the effectiveness and reliability of a Web GIS system is determined by the standard of the GIS server it uses. The quality and standard of the Web GIS application is dependent on the functionality, scalability and ability to be customized of the GIS server. The GIS database is the backend support for any Web GIS application. The quality of the data in the GIS database, determines the standard of the result generated by the Web GIS application. Professional applications definitely need the up-to-date, reliable and high-quality data set. Slowly, it was becoming obvious that to maintain a quality and up-to-date Web GIS database it needs a collaborative contribution. There are clients who are accessing the system for information, but at the same time there might be some other end-users who can update the system with recent information about their locality. The first type of clients are just sending query in the system and accessing the information. They don't have any idea what is going on at the backend of the system, they don't

need to know about the backend processes. But the Web GIS system administrator slowly realised the need of another group of authenticated end-users who can perform some geo-spatial processing tasks. Web GIS initiated from a basic assumption that the global geo information cannot be captured, saved and customized under a single organizational unit. The second group of authenticated end users can provide the up-to-date information and can be accessed globally. This concept of collaborative contribution for the system leads to the new avenue of Geospatial science and technology called Geospatial Mashups. It is the modern technology of providing web mapping or GIS services globally. Integration of multiple data layers or datasets, often from multiple sources, is one of the most common functional requirements of GIS applications (Fu et al., 2011).

The term "Mashup" is derived from pop music, where the musicians create new songs by remixing multiple sound tracks together. Today's web user can create content on the web both collaboratively and individually, allowing for a personalized web experience through wikis, blogs, podcasts, photo sharing, and other technologies. GIS and mapping applications have both benefited from and contributed to these trends, collectively called "Web 2.0" (Pierce et al., 2009). According to OGC (2002), Web Feature Service is one of the most important web data service. It allows a client to retrieve heterogeneous geospatial data from multiple geospatial data servers. Using HTTP as the distributed computing platform it allows fun-

damental database Query operations like, Select, Update, Insert, Delete etc. The counterpart Web Map Service is defined by OGC (2004) as the service that is capable of creating and projecting maps that come concurrently from different heterogeneous sources in any of the following standard image format, SVG, PNG, GIF, and JPEG. WMS consists of three basic operations, namely,

- *GetCapabilities*,
- *GetMap* and
- *GetFeatureInfo*.

These three operations lead to a new feature of remixing data in the web called as the Mashup feature of the Web GIS. In Web GIS, geomashup is being used. A geomashup is a Mashup where at least one of the contents or functions is georeferenced. Geospatial Mashups integrate multiple data sources based on common geographic locations. Mashups carry the overlay functions. In an overlay function, information from different

heterogeneous sources are merged together and represented as a single informative Mashup layer. It includes topological overlay which restructures into a single vector dataset and a graphic overlay which superimpose images or maps on top of other. Most of today's online Mashups are graphic overlays. The simple architecture of Web GIS consists of a server end and client or browser end. The Mashup operation can be implemented in both ends. If the Mashup operation is performed in the server end, it is called a Server-side Mashup and if on the client end it is called as Browser-side Mashup. In the Server-side Mashup architecture, the Mashup web server sends requests to different web services, receives the responses and merges the results. Figure 4 depicts the Server-side Mashup architecture.

In the Browser-side Mashup architecture, the web browser sends requests to different services, receives the responses and displays the composite result. Figure 5 depicts the Server-side Mashup architecture.

Figure 4. Server-side Mashup Architecture

Figure 5. Browser-side Mashup Architecture

Both the architecture has some advantages and disadvantages. The advantage of Server-side Mashups is that the server has more powerful hardware and software than the browser, but these Mashups also require specialized programming tools and complex-server side programming, which includes more manual work during development and deployment. Because of this complex programming and tedious work, the original Server-side Mashups were mainly limited to professional programmers. But most of the today's Mashups are Browser-side. It uses mainly lightweight programming; as a result it has become easy to develop and professional GIS companies have adopted this approach as an easy and fast way to develop Web applications. ArcGIS by ESRI is one such example.

This recent trend of Geospatial Mashup has significant impact on Web GIS. The next section will highlight on the design pattern of Mashups in Web GIS. The common design pattern consists

of three components: Basemaps, Operational Layers, and Tools.

- Basemaps
 - It provides the initial framework for any geomashup. It is the frame of reference like, the aerial imagery maps often from the web services of Google, Yahoo, ArcGIS Online etc.
- Operational Layers
 - It is also known as the thematic layers, usually embedded on the top of a basemaps, like Café, building names, street names, bus stops etc.
- Tools
 - It can execute logical and analytical functions.

Mashups can potentially combine any type of contents and functions over the web, regardless of whether a formal programming interface is

available. The vast majority of contents over the web are HTML pages and photos that don't have formal APIs, but they contain a huge amount of valuable information that can be scraped and geospatially tagged or referenced and then reused to build new and value added applications. Virtually, the whole web can be remixed, which opens the door to unlimited value-added Mashup applications (Fu et al., 2011).

Application of Geospatial Mashup in Tourism

The ability to examine data in its spatial context is extremely important. The geocoding process takes a simple street address and matches it to a database containing address ranges for every link in the street network. In this way customer lists may be converted into simple dot maps, or coupled with census data and displayed as maps of market penetration (Goodchild et al., 1984). This research paper concentrates mainly on the application of Geospatial Mashups in tourism sec-

tor. With respect to the tourism industry the map Mashup can be classified into four broad sections:

- Informative Mashup
- Participatory Mashup
- Collaborative Mashup
- Enterprise Mashup

Check the Google map illustrated in Figure 6.

The initial map was developed without the detail information about the stadium, the tourist lodge, the hotels, the schools, colleges, banks and the historical and religious architectures like Nandalal temple, Chinnamasta mandir etc. Initial aerial imagery map was only with the land structure and the roads, that is the Basemaps. Other than the road and basic framework the basemaps include the water-bodies like the Lal Bandh or other basemaps' objects mention in blue in the above Google Mashup map. Next in the Operational Layers other end users have implemented Participatory or Collaborative Mashups. Some end users are providing the information of the

Figure 6. Mashup in Web GIS

Source: www.google.com/maps/

historical place of interest like the temples. Some other client has supplied the information about hotels, restaurants and banks. Few others may have contributed in providing information about the local school, colleges and health centers. There is high probability of receiving the data from different clients in heterogeneous form. When all these heterogeneous data is compiled and remixed using WFS and WMS service, it results into this detailed map, containing every in and out about the location. Thus, this Mashup service is providing detailed information about a location in a collaborative manner. The basic information are required by a potential tourist to visit any tourist location. Initially, the tourists have to depend on the information provided by the travel agents about a location. The agents used to provide the information over telephonic conversation or sharing documents over email. The information may not be up-to-date and the tourists have to solely trust the agents. The tourists could have viewed the aerial imagery maps over the internet, but those maps don't provide detail information about the road, hotels, place of interest, transport facilities available etc. But now with the detailed geospatial Mashup services over any Web GIS applications, the tourists can collect every in and out detail information about their place of choice. They have to just browse the internet, run the online Web GIS application and run a query. They will receive detailed information about the location. Another greatest advantage in this Participatory or Collaborative Mashups is that, the globally accessible geomashups are always up-to-date; they contain the most recent information about the location. Even the tourists while visiting those tourist sites if they found something is not matching with the Mashup information over the internet, they can customize those published information with the updated one. This will be beneficial for other potential tourists. These are the benefits of updating information of those locations which are already established as tourist spots. Now, if some entrepreneur or travel agency wants to project a new location as a tourist spot, they can perform

initial research work to analyse whether their local area can be a potential tourist location or not. First and foremost they have to find out whether that particular location has any Cultural, Ecological or Modern tourism component or not. If it is there they can update that information using the Mashup option in Web GIS application. Next, they have to update other facilities like, transport, hotels, café, health service etc. even internet facilities available or not. That means, the locations which can be potential tourist spots can slowly come into limelight just by some simple initiatives taken by locals. One such online application provided by Google is <http://www.editor.giscloud.com/> where the end users can update and create a map online contributing detailed information about their locality or any other place of interest. They don't need any Government intervention. In this way the Goespatial Mashups are making hundreds of new Cultural, Ecological or Modern tourist locations popular. This is effecting overall economic development of the location through tourism industry. On the other hand, in today's competitive marketplace, leading companies are analyzing and listening what customers really care about. Traditional forms of marketing are no longer as effective as they used to be in the past. This is where Web GIS comes in and allowing the companies to visualize where potential customers are located by analyzing demographic, psychographic, purchasing, and spending characteristics for accurate customer segmentation and helping the companies to find more like them (GIS for Marketing: Where Strategy Meets Opportunity, 2010). The tourism sector is implementing the Web GIS Mashup application as a promotional and marketing tool.

Challenges

Mashups provide different opportunities for sharing data collaboratively and using information in new applications and systems. It has become an integral design pattern for Web GIS applications. As more and more functions and applications

become available over the Web and more policies and technologies favour the use of Mashups, this branch of geospatial science and technology will grow exponentially in future and will contribute in tourism industry. Like all other technologies Mashup also has few challenges and demerits. New research works are going on to address the following drawbacks of Mashups:

- **Quality and Reliability of Information**
 - Using the Participatory and Collaborative Mashups anyone can publish contents over the internet. No one is authenticating the genuineness of the uploaded information. Quality can vary enormously, and if questionable sources are implicated in a chain of services, the results of uncertainty or error can be propagated over the internet. This can produce misleading and even wrong information (Goodchild et al., 2010).
- **Copyright and Ownership**
 - While the spirit of open exchange is still the main characteristics of the web, many websites post terms of use and retain their copyright. Copyright and terms of use can get complex when a Mashup uses multiple web resources, or even more complex when a Mashup uses information generated by another Mashup. It is important for Mashup developers to comply with provider's terms of use to avert future disputes and to understand the impacts of copyright on their application (Fu et al., 2011).
- **Security**
 - Enterprise Mashups can involve confidential information sharing over the internet, making security a key consideration.
- **Technical Challenges**
 - Technical challenges in dealing with map Mashups are mainly related to

technical incompatibility, data integration and quality assurance, interfaces and functionality, level of programming skills required, enterprise integration, etc (Li et al., 2008).

CONCLUSION

Impact of ICT in tourism is very vital. For instance, a guide requires historical and cultural information about the destinations, tour agency requires information on transformation, reservations, accommodation in Hotel, and for marketing, a tourist requires information from Cell Phone Application (SMS), Internet, Wireless (Wi-Fi), VOIP, GPS, GIS, Digital Radio, On demand application and so on. Role of Information Technology in tourism industry cannot be underestimated because it has vital contributions. Once the tourism information or data is in the system (computer) this may be transmitted to the proposed tourists through different channels viz. FAX, GPS, Website etc. One of these informative IT tools is Geospatial Information Technology (GIT). GIS is an information system that provides functions including visual presentation about the tourism destination, advanced analyses, etc., of digital geospatial information by processing it in an integrated manner on electronic maps of the tourist site. The benefits of Web GIS, especially Geospatial Mashups far outweigh its limitations and challenges. Web GIS disseminates maximum level of information to the potential tourists, at the same time allows the travel agents or organizations to promote an unknown location having adequate features to be a popular historical, ecological or modern tourist spot. The potential tourists can analyze demographic, economic, psychographic, market characteristics of the location just on a click. Thus, providing support for strategic planning, Collaborative information sharing, online marketing techniques, improving efficiency in tourism management and attaining competitive locational and business advantage for the tourism agencies. The future research scope

of this present paper depicts the application of Web GIS and Geospatial Mashups and how this modern GIT system can be used well as an analytical and strategic tool in tourism management and promotion.

Followings are the domain of future research in Web GIS and Geospatial Mashups in context to tourism business.

1. Web GIS Applications in tourism resource inventories
2. Web GIS application to location suitability under conflicting demands
3. Monitor and control tourism activities using Web GIS
4. Application of Web GIS in visual impact analysis in tourism research
5. Application of Web GIS community involvement and participation in tourism research
6. Web GIS uses as a decision supporting tools in tourism research
7. Application of Geospatial Mashups in tourism promotion
8. Limitations in Geospatial Mashups and their solution

KEY TERMS AND DEFINITIONS

CRS: Computer Reservation Systems is a computerized system used to store and retrieves information and carry out transactions related to the information or booking of airline ticket, railway ticket, hotel booking etc. CRS has made the online booking and collecting information much easier, faster and effective.

Geospatial Mashups: Mashup is picking data or functionality from different sources (both homogeneous and heterogeneous) on the web and

combining them within the browser to present to the user. On the Web GIS context, a Mashup is the process of merging multiple sources of data, both spatial and non-spatial, into a single integrated spatial display. It is about extracting spatial data from a non-spatial source and combining with other spatial data and finally displaying it on a map.

GIS: Geographic Information System is one of the most popular tools of GIT. It is the modern technology for capturing, storing, retrieving, manipulating, mapping and analyzing spatial and non-spatial geographical data in the digital format. GIS is the information system that provides functions including visual 3D presentations about any geographical locations, advanced analysis etc. of digital geospatial information by processing them in an integrated manner.

GIT: Geospatial Information Technology is a collection information communication tools used to capture, store, transform, manipulate, analyze, and produce information related to the surface of the Earth. This data may exist as maps, graphs, 3D virtual models, tables, and/or lists. Example: GIS, GPS etc.

GPS: Global Positioning System is one of the most popular tools of GIT. GPS is a radio navigation system that allows land, sea, and airborne users to determine their exact location, velocity, and time 24 hours a day, in all weather conditions, anywhere in the world. The GPS is being used in science to provide data that has never been available before in the quantity and degree of accuracy that the GPS makes possible.

ICT: Information and Communication Technologies, it refers to technologies that provide information through telecommunications. ICT and Information Technology (IT) are more or less similar, but ICT focuses primarily on communication technologies. This includes the Internet, wireless networks, cell phones, satellite systems and other communication mediums.

Tourism: Tourism is a social, cultural and economic phenomenon related to the movement of people to places outside their usual place of residence. Tourism comprises the activities of

persons travelling to and staying in places outside their usual environment for not more than one consecutive year for leisure, business and other purposes not related to the exercise of an activity remunerated from within the place visited.

Tourist: Someone who travels for pleasure and recreation and exchange of culture.

V. R. Technology (V. R.): Virtual Reality Technology is a computer-simulated environment that can simulate virtual reality, i.e. an artificial environment created by software and presented to the user in such a way that the user accepts it

as a real environment. In VR, highly visual 3D environments are created by using CAD software and graphics hardware. VR has its application in different sectors viz. Military training, Architecture, Game, Medical Procedures etc.

VOIP: Voice over Internet Protocol is a collection of technology for the full duplex real-time transmission of voice communications and multimedia sessions over the internet. VoIP offers a substantial cost savings over traditional long distance telephone calls.

Archaeological GIS for Land Use in South Etruria Urban Revolution in IX–VIII Centuries B.C.

Giuliano Pelfer

University of Florence, Italy

INTRODUCTION

Urban Revolution in Ancient Etruria Between IX–VIII Centuries B.C. Origin of the Etruria Protocities

Archaeological discussion about protourban centers growth in middle Tyrrhenian and in Ancient Etruria regions outlined the original and revolutionary features of such process, called Villanovan Revolution for resuming the deep transformations occurring in a few decades.

New largest protourban settlements grew through the concentration, fusion and absorption of the earlier scattered sites on the plateaux of South Etruria, extended for many hectares and well defended (Bartoloni, 2002; Bietti Sestieri, 1996; Carandini, 2003; Mandolesi, 1999; Pacciarelli, 2000; Peroni, 1994, 1996).

Geographic position of plateaux and agrarian quality of adjacent soils were the key factors for settlement position selection. Tens of scattered older villages were abandoned with simultaneous people transfer, called synoecism, to the plateaux from the late final Bronze age to the first Iron age. The process features, the plateaux selected and their area extension would prove existence of some urban planning. New settlements extension, until to about 200 hectares, would testify the great dimension of the new communities born from synoecism (Peroni, 1969, 1994) and a gradual reduction of settlements number with significant increase of their population size and surface extension (Carandini, 2003; Pacciarelli, 2000).

Analysis Objectives

Although many aspects of protourban centers growth, like the foundation of Rome and its organization in *curiae* are investigated, relevant criticism remains about the same processes in South Etruria. In fact, some issues about the strong changes in settlement patterns observed in this period have to be yet clarified and deepened (see Background section - Bartoloni, 2002; Pacciarelli, 2000; Peroni, 1994).

The present research has the goal to explain the main factors that favored such historical process as well the features of the settlement strategies.

Use of GIS is the most powerful technology introduced to archaeology since the introduction of carbon 14 dating and seems the most suitable for specific information.

Most widespread use of this technology is for Cultural Resource Management, data visualization, excavations but also for prediction of archaeological site locations.

This paper focuses on the use of GIS for archaeological predictive modeling of ancient land use, by critically applying this new technology and exploring its theoretical and analytical implications. Archaeological data are point like geographical and temporal data with more or less large uncertainty. Work of the archaeologists is to connect all the point like data related to a geographic region and to an historical period using a qualitative and quantitative based narration that fit in the best way with available data and with the theory and model.

DOI: 10.4018/978-1-5225-2255-3.ch298

An archaeological GIS is designed with the aim to record the existing and reconstructed data on a database, to visualize data by thematic maps and to use such data for advanced statistical and spatial analysis. Archaeological GIS is realized installing GRASS GIS on OS Linux with interface to PostgreSQL database, with its extension PostGIS for geographic information and to R package for statistical and geostatistical analysis.

BACKGROUND

Archaeological Theories on Protourban Centers Genesis

Archaeologists suggested two approaches to protourban centers origin: the first approach underlined a continuity between protourban centers and earlier settlements through gradual development of settled areas, between the late final Bronze age and the beginning phases of first Iron age (Pacciarelli, 2000); the second approach suggested an ungradual transition from the scattered villages on the territory to the protourban centers with an extension 30 times larger than the villages of preurban phase (Peroni, 1994, 1996). Surface surveys of last fifty years showed an uniform distribution of the villanovan pottery remains, attesting a protourban phase after 1,000 B.C., with occupation of large areas, because of transformations in social and economical structures (Pacciarelli, 2000).

Villanovan Urban Revolution During X-IX Centuries B.C.

Studies of Peroni and Rittatore Vonwiller in the 1960s (as cited in Pacciarelli, 2000, pp. 11-12) outlined the close relationship of Urban Revolution in South Etruria with social, political and economic transformations starting from 1,000 B.C. Changes concerned the techniques of agrarian production, the work organization and the social relationships.

A new economic organization of the agrarian property is based on the private ownership of land by division into lots for households (Mandolesi, 1999; Pacciarelli, 2000; Peroni, 1994).

In this context the nuclear family emerged as the basic social cell of the protourban centers, replacing the older multi familiar clans.

Social hierarchies reflected kinship and rank relationships, as shown from the funerary data since the X century B.C. (Bartoloni, 2002, 2003; Iaia, 1999; Pacciarelli, 2000; Peroni, 1996).

Urban Revolution developed between XII-VIII centuries B.C. in the Mediterranean area (Moscato, 2001) and along Mediterranean sea coasts, favored by the emergence of a global Mediterranean market area. New situation produced huge changes: villages in a few tenths of years disappeared and protourban centers grew.

Collapses of the great eastern territorial empires and of the earlier palatial states, also due to the invasions by the People of the Sea, promoted the propulsive role of Phoenicians in the new Mediterranean global market between XII-VIII centuries B.C.

Such role of Phoenicians has been recognized in the last decades (Braudel, 2002; Giardino, 1998; Guidi, 1998; Liverani, 1988; Moscato, 2001; Pacciarelli, 2000; Trigger, Kemp, O'Connor, & Lloyd, 2000). Because of Phoenicians maritime activities, autonomous urban centers developed in the Etruria, middle Tyrrhenian and in central Aegean areas.

Case Study: Tarquinia

The Tarquinia settlement is an important case study on the genesis of protourban centers (see Figure 1.)

The surface surveys testified the uniform distribution of the villanovan pottery in all area, showing a full plateaux extension of the protourban center. Data show that the main center covered about 120 hectares on main plateaux of La Civita, including the oldest final Bronze age

Figure 1. The Tarquinia protourban center between final Bronze age and first Iron age

La Castellina and Cretoncini sites (Di Gennaro, 1986; Hencken, 1968; Mandolesi, 1999; Pacciarelli, 2000; Peroni, 1996).

The protourban center geographical structure is organized in three settlement subsystems: La Civita and the Calvario, Infernaccio, Acquetta villages on Monterozzi hill, their corresponding cemeteries, and the satellite coastal settlements of Fontanile delle Serpi and le Saline. The oldest settlement system developed on La Civita and on Castellina and Cretoncini sites with their cemeteries (Bietti Sestieri, 1996; Hencken, 1968; Iaia, 1999; Linington, 1982; Mandolesi, 1999; Pacciarelli, 2000; Peroni, 1996).

Funerary data and cemeteries distribution fit well with all the approaches about the protourban genesis and for this reason such information cannot be used for supporting neither theory (Carandini, 2003; Mandolesi, 1999).

The social evolution of the protourban center, linked to familiar subgroups, likewise to the organization of the future *curiae* and *gentes* in the archaic Rome (Giardino, 1998; Mandolesi, 1999), extended the settlement system to the Monterozzi

hill as shown by the cemetery at Le Rose near to the Calvario village (Carandini, 2003; Moscati, 2001; Pacciarelli, 2000). Monterozzi hill becomes important for its favorable position for coastal plain visibility and control.

MAIN FOCUS

Agrarian Production in Final Bronze Age

Ancient sources and archaeological data recognized key economic role of agriculture and sheep farming in the Etruria villanovan communities (Colonna, 2000; Pallottino, 1937; Sassatelli, 2009). The increasing demand of cereals characterized exchanges intensification during Urban Revolution. From late Bronze age, the agrarian activities prevailed on other ones, as proved by small amount of wild paleozoological remains. Changes in agrarian activities are due to major economic and social transformations as well to larger diffusion of bronze working tools rather

than to great innovations in the farming technology (Ampolo, 1980; Peroni, 1994; Sassatelli, 2009). In fact, heavy soils plowing required a larger work and time amount supplied by motivated people and by new work organization, before the iron plowshare developed (Forni, 2002; Peroni, 1994; Van Joolen, 2003).

The Main Crops

Ancient sources testify that selected cereals like the hulled wheats as *triticum monococcum* and *triticum dicoccum* (spelt) and the naked wheats as *triticum aestivum* and *triticum compactum*, were used in agriculture until to the VIII century B.C. (Bartoloni, 2002; Bietti Sestieri, 2002; Sassatelli, 2009). Sources clarify which were the more diffused crops and the suitable requirements for soil features (Columella, II, 9, 5-9; Varro, I, 9; Cato, 6,1).

All the variables linked to cultivated crops and agrarian techniques are used for understanding and modeling the productive process. The grazing and the breeding were also important activities in villanovan economy (Bedini 1997; Sassatelli, 2009).

This is testified by paleozoological remains in many protohistorical sites.

The breeding could be practiced both around plateaux and on coastal plain, due to proximity of rivers and lagoons as water resources satisfying animals daily needs.

Bovines were utilized for agrarian work and for increasing land productivity by their manure, but not for food, because religious tradition forbidden to eat their meats (Ampolo, 1980).

Instead, sheep and goats grazed on free terrains as well in the coastal plain marshy areas and were used in particular for milk and the secondary products, as wool and skins.

Territory Control and Viewshed

An optimal position respect to available resources and to communication ways could also explain the settlements location choice. The resources avail-

ability in surrounding territory was crucial factor for protourban centers growth, like its control by the main settlement.

The viewshed analysis can outline these factors and is also useful for defining the cultural and cognitive landscape (Van Leusen, 2002).

Issues and Problems

Archaeological land evaluation estimates ancient land uses of the studied territories.

Soil scientists developed land evaluation methods for estimating alternative soil uses.

The outcome is a limited number of alternative land uses for the different situations, according to geomorphological framework that allows to classify the landscape in different Landscape Systems, identified as homogeneous areas for their physical, geomorphological and ecological features.

The main goal of such classification is to distinguish such territorial areas with their specific features for favoring the agrarian soils classification with the suitability categories for different crops.

These methods are based on reorganization and interpretation of inventories of soil, vegetation, climate and other aspects of land, for comparing alternative land uses, and their requirements with land resources.

This approach, used in physical geography, has then to be replaced by models built on protohistorical context based on ethnographic, archaeological and historical sources.

SOLUTIONS AND RECOMMENDATIONS

Methodology

Tables and maps for the ancient land use are created by many and complex steps.

All the thematic maps needed for land use analysis are defined.

The list includes the Digital Elevation Model (DEM), the topographic maps, the geological and

hydrological maps, the land cover maps, the soils maps, the land use maps and any other useful map. Data available were generally not digitized and georeferenced.

Available maps displaying the present or the historical situation used different datums and coordinate systems. Any map had to be represented by using the same datum and the same coordinate system by suitable mathematical transformations.

Data finally have been stored in PostgreSQL database with PostGIS extension.

The same group of thematic maps, as in defined list, was built following an historical order, that starts from the present and includes historical periods for which data useful for analysis, although not complete, were available. Any group of thematic maps is characterized by the parameter of time indicating the historical period referred to the group of maps itself.

A time series of thematic maps has been built to infer the information needed for ancient soils maps. The maps information from historical sources and from archaeological remains, going back in time, is incomplete or missing.

GIS based model for reconstructing past soils maps and for watershed analysis has been built. The model used a geostatistical approach to the analysis of the time series of thematic maps, to predict the ancient soils maps: an approach similar

in some extent to the one used to predict the future soils maps (Rossiter, 1994; Van Joolen, 2003).

The evaluation of ancient soils suitability to main used crops required further information on ancient crops, on used techniques, on work organization due to the large scale changes in agrarian activities. For establishing the soils suitability to the main used crops, the physiographic and pedological features of Land Use Requirements (LUR), as drain categories, typology, depth, slope, and so forth, have to be related with the needed Land Use Qualities (LUQ), as moisture, workability, nutrients, and so forth, that represent the soil capacity to satisfy the proper requirements. This is shown in Table 1.

The latter allow to define the specific Land Use Types (LUT).

From the previous tables other ones can be extracted for the specific land use where the needed requirements correspond to the pertaining features according to the general table itself.

LUR have to be measured and related to the LUQ, classified in Severity Levels and Degrees of Limitation, that are the categories of LUR for any LUQ.

From this information and from the land features, three main suitability categories for Severity Levels and Degrees of Limitations for any specific

Table 1. Relationships between LUQ and LUR for soils crop suitability

Land Use Qualities	Land Use Requirements
Moisture	Drain categories
	Soil suitable depth
	Field capacity
Nutrients	Soil typology
	Soil thickness
Workability	Slope
	Stones or rocks presence
	Poor drainage
	Soil texture
Erosion risk	
Rooting conditions	Stages
	Soils structure and texture

land use, are defined: suitable, partially suitable, not suitable (Cremaschi, 2000).

For such information look at Table 2 and Table 3.

Territory maps for any soil feature, as slope, soil typology, available moisture, texture, and so forth, can be built by GIS. The maps obtained with this method are superimposed.

The suitability category of a soil is defined by its more unfavorable feature, whatever is the assigned value to the other features.

Main crops suitability are shown in Table 4 and Table 5.

Table 2. LUT for spelt

Land Use Type (LUT)		
Spelt cultivation on medium-sized plots		
Land Use Quality (LUQ)	Land Use Requirements (LUR)	Suitability categories
Moisture	Soil depth	
	• Less than 30 cm • More than 30 cm	• Not suitable = 3 • Suitable = 1
	Drain categories	
	• Poorly drained • Drained • Very drained	• Suitable = 1 • Suitable = 1 • Not suitable = 3
Nutrients	Soil typologies	
	• Luvisols, Vertisols, Fluvisols • Arenosols, Regosols, Planosols • Leptosols • All other types	• Suitable = 1 • Not suitable = 3 • Suitable = 1
	Lime content in the soil	
	• Very calcareous • Calcareous • Non-calcareous	• Not suitable = 3 • Partially suitable = 2 • Suitable = 1
Workability	Soil texture	
	• Sandy soils • Loamy soils • Clayey soils	• Not suitable = 3 • Suitable = 1 • Suitable = 1
	Slope class	
	• 0-13% • 13-55% • >55%	• Suitable = 1 • Partially suitable = 2 • Not suitable = 3
	Stoniness class	
	• 0-3% • 3-90% • >90%	• Suitable = 1 • Partially suitable = 2 • Not suitable = 3
	Rockiness class	
	• 0-10% • 10-50% • 50-100%	• Suitable = 1 • Partially suitable = 2 • Not suitable = 3

Table 3. LUT for other cereals

Land Use Type (LUT)		
Other cereals cultivation on medium-sized plots		
Land Use Quality (LUQ)	Land Use Requirements (LUR)	Suitability categories
Moisture	Soil depth	
	• Less than 30 cm	• Not suitable = 3
	• More than 30 cm	• Suitable = 1
	Drain categories	
	• Poorly drained	• Not suitable = 3
	• Drained	• Partially suitable = 2
	• Very drained	• Suitable = 1
Nutrients	Soil typologies	
	• Luvisols, Vertisols, Fluvisols	• Suitable = 1
	• Arenosols, Regosols, Planosols	• Not suitable = 3
	• Leptosols	• Partially suitable = 2
	• All other types	• Partially suitable = 2
	Lime content in the soil	
	• Very calcareous	• Partially suitable = 2
	• Calcareous	• Suitable = 1
	• Non-calcareous	• Not suitable = 3
Workability	Soil texture	
	• Sandy soils	• Not suitable = 3
	• Loamy soils	• Partially suitable = 2
	• Clayey soils	• Suitable = 1
	Slope class	
	• 0-13%	• Suitable = 1
	• 13-55%	• Partially suitable = 2
	• >55%	• Not suitable = 3

Table 4. Land suitability for spelt

Spelt	Suitable	Partially suitable	Not suitable
Soil requirements	At least 30 cm thickness		< 30 cm thickness
	Clayey soils, loamy clayey soils, loamy soils	Loamy soils	Sandy soils
	Moderately drained (wet) or drained	Marshy	Very drained (dry)
	Firmly structured		Loose
	Marginally fertile or fertile	Fertile	Very fertile
	Non-calcareous	Calcareous	Very calcareous
		Medium salinity	
Cultivation requirements	Rotation system of one to two years		
	No manuring		
	No irrigation		

Table 5. Land suitability for other cereals

Other cereals	Suitable	Partially suitable	Not suitable
Soil requirements	Deep soils		< 30 cm thickness
	Clayey soils	Loamy soils	Sandy soils
	Drained or very drained	Drained	Poorly drained
	Firmly structured		Loose
	Fertile or very fertile		Unfertile
	Calcareous (Marls)	Calcareous	Non-calcareous
	Plains	Hill slopes	
	Relatively warm		Cold
	Open and elevated position		
Cultivation requirements	No clear indications		

Data Analysis and Results for Land Use

The analysis provides an archaeological evaluation of land use to define a potential adaptability of soils of Tarquinia area to various types of land uses and to the recognized major cereal crops, like spelt or cereals that demand requirements other than those of spelt.

Data available, reconstructed or estimated by environmental, historical and archaeological information are used. Land requirements needed to cultivate specific crops are calculated by some predictive models developed to infer the ancient soils adaptability.

Models used a set of synchronic thematic maps from present to past for any single chronological step. Ancient sources, the studies carried out so far and any added element are used to complement the analysis on soils and their requirements, up to build tables and maps on LUR, LUQ, LUT (Bedini, 1997; Boerma, 1989; Cremaschi, 1992; Hunt, Malone, Sevink, & Stoddart 1990; Karmersmans, Loving, & Voorrips 1985; Mallegni, Rottoli, & Bruni 2001; Peroni, 1994; Van Joolen, 2003; Van Leusen, 2002; Renfrew & Bahn 1995; Rottoli, 1997).

The soils requirements suited to investigated crops are shown in the maps, in different colors. The analysis shows that the plateaux of La Civita

are placed at the center of a large area, including the coastal plain, the river valleys and the surrounding land, suitable without restrictions or partially suitable to the spelt specific culture as the coastal plain and the river valleys, while is partially suitable for other cereals as the belt surrounding the plains and the hills of the interior geographic system, including the Monti della Tolfa. Figure 2 and Figure 3 show the results.

Data Analysis and Results for Viewshed

The visibility analysis established which parts of the territory are visible and from which points, and which positions were strategic for territory control with its territorial hierarchies and its cultural and cognitive landscapes (Van Leusen, 2002; Wheatley, 1995).

The identification of the points used for visibility analysis into settlements is the first important step. In fact, settlements and urban centers were not surrounded by wall with watchtowers. The intervisibility between the three Monterozzi villages and the Pian della Regina on La Civita, emerged as cumulative viewshed of the territory visible from these settlements, can explain the settlements location on the plateau highest point. Also viewshed analysis confirmed central position of the protourban center located on the main

Figure 2. Map of soils suitable, partially suitable and not suitable for spelt cultivation

Figure 3. Map of soils suitable, partially suitable and not suitable for other cereals cultivation

plateaux of La Civita and demonstrated that from first Iron age settlements on Monterozzi hill it was possible to control all the coastal plain, the Mignone and Marta river valleys, the La Civita plateau (Mandolesi, 1999).

The viewshed analysis demonstrated also that the settlement location on La Civita plateau is further justified by its visual control on important areas like Marta valley, coastal plain, roads, Saline harbour (see Figure 4).

FUTURE RESEARCH DIRECTIONS

Archaeological GIS and Multi Agent Based Models (MABM) From Models to Archaeological Data

Although GIS based model used for reconstruction of ancient land use integrate well in a spatiotemporal uniform framework the available data, its approach based on analysis and interpretation on main important patterns for going back to the protourban processes, is static.

Integration of MABM simulations with archaeological GIS can allow to overcome GIS model limitations to better explain the dynamics of protourban processes.

So achievement of an investigation level more precise using computer simulations of dynamical evolution of the archaeological landscape is possible.

Tarquinia is an emblematic case study for South Etruria protocities origin, due to complexity of the settlement pattern starting from medium Bronze age, when small settlements coexist with large ones located on plateaux (Mandolesi, 1999) (See Figure 5).

The Multi Agent Based Models – MABM – analysis seems the best way for analyzing Tarquinia protocity dynamics and development between X-VIII centuries B.C., for discriminating between different hypotheses.

MABM simulations are necessary if the analysis purposes are a better interpretation of protourban processes dynamics, including paleo-agriculture and paleoproduction (Kohler, 2005). MABM simulations start from archaeological

Figure 4. Cumulative viewshed between La Civita, the coastal plain and the villages on the Monterozzi hill

Figure 5. Preurban settlements of the older Bronze ages in the Tarquinia territory

and anthropological theories and models and its results are compared with archaeological records in an approach top to bottom.

The archaeological GIS integrated with MABM develops into a testbed laboratory for validation of models on social and cultural processes dynamics (Parisi, 2001).

CONCLUSION

Land Use Results Discussion

Also heavy clay soils of the Marta and Mignone rivers valleys, partially suitable for cereals, became cultivable only after deforestation, drainage and tillage.

Agricultural productivity was improved by intensive use of available technologies.

Agricultural practices and production increased for incentives caused by endogenous and exogenous factors that affected paleoproductivity indexes of various wheats (Ampolo, 1980).

These factors were a consequence of protourban center development.

In fact, the hypothesis that the people displacement on the plateaux, from the final Bronze age, was due to the availability of large adjacent amount of land suitable to cereal cultivations, is confirmed. Other factors affecting the settlements choice were favorable geographical and environmental conditions, due to large homogeneous districts of plateaux, to position near to sea and to two rivers, accessible but also well protected, and to well accessible woods and pastures.

For instance, the sites settled from the final Bronze age on the coastal plain like Fontanile delle Serpi in central position of land suitable to spelt cultivation and to grazing, meet similar criteria.

Viewshed Results Discussion

Viewshed analysis is very important for archaeological interpretation of protourban process and is relevant for many discussed aspects.

Viewshed analysis showed an easy control of the territory by the protourban center, but also by the settlements on Monterozzi hill. Control was very important during the deforestation of the coastal plain and river valleys. In fact, the agrarian practices of igniculture were used for obtaining soils suitable for agrarian activities in large areas. The control of fire diffusion during these practices was certainly very important to avoid dangerous consequences.

Other coastal and landing sites could play similar control of coast.

Visibility analysis helps to predict new sites not yet discovered.

In first Iron age, Saline settlement was the coastal plain control site, as before were the Monterozzi villages. Throughout Iron age, the Saline settlement controlled waterfront and Monterozzi villages will be abandoned. When Tarquinia later developed into City State, Monterozzi hill became, with Arcatelle necropolis, the Tarquinia larger burial area, integrating La Civita main town with Ara della Regina temple and coastal Gravisca and Le Saline settlements.

Overall Discussion

The major reasons for populating plateaux were the need of land accessible and suitable to cultivate cereals and of areas for building households. In late final Bronze age motivations for making cultivable the fertile lands represented by the wetlands of the coastal plain and river valleys can be explained by social and economical changes.

In fact, the Fontanile delle Serpi site of final Bronze age, located in the alluvial coastal plain on the edge of an ancient lagoon, was created in relation with intensive spelt cultivation on the coastal alluvial soils, and the Saline first Iron age was important site for the exploitation of the coastal plain resources. Agrarian surplus production is linked with growing demand due to increasing exchanges and to demographic development in the villanovan Tarquinia between X- VIII centuries B.C. The subsistence economy

of early villages located on the hills and river terraces, based on collective land ownership, was replaced by agricultural soils intensive exploitation to a greater extent, connected with new land ownership by households from final Bronze age (Bartoloni, 2002).

The protourban centers growth is a dynamic process carried forward from transformations in social structure and in production organization, compared with preurban clans organization. Villanovan society organized in households landowners reacted to market expansion in Mediterranean area. Demand of commodities like cereals and wheat increased for demography growth and for development of Mediterranean global market.

The settlement evolution shows the transition from resources management in catchment area plenty for the subsistence preurban villages to resources growth linked to the increasing scale of economic activities for emerging protourban centers.

The problem of protourban centers is how to produce a larger amount of agrarian products on a wider territory with more productive methods. For such reason new social organization linked to intensive agrarian production is based on private agrarian ownership. This new structure made possible a more effective work organization and a more rational resource management by deployment and concentration of the productive forces and ways of production on larger scale.

This pattern is reflected from the household clusters divided in *curiae*, according to the future model of the archaic Rome, using cooperation and coordination for managing a growing economy (Carandini, 2003).

In this context, plateaux work as possible territorial attractors: that is, places where households converged to favor common activities in agrarian works as tillage with igniculture and economical exchanges, both for external and internal markets in protourban centers, where material and human resources were concentrated.

With the synoecism, whatever bonds, internal and external to the villages, could favor people

concentration on same area, for supplying new economical requests and transformations. Demographic growth was an important factor for the production increase but also is the consequence of such increase: so that demographic growth has to be intended as cause and effect of the villanovan society changes.

These conclusions show the relevance of the GIS and of its results on ancient land uses, for selecting between the theories on the origin of the protourban centers (Bartoloni, 2003).

KEY TERMS AND DEFINITIONS

Historical Ecology: Ecology of the historical natural environment.

Landscape Archaeology: Archaeology of ancient landscapes.

Multi-Agent Based Models: Simulation with multi-agent based models for the analysis of ancient social systems dynamics.

Paleoagriculture: Ancient agrarian techniques and crops.

Protourban Center: Urban settlement before the City State.

Synocism: Collective population transfer from one site to another.

Territory Control: Ways and geographical places for territory control.

Viewshed: Territory area visible by selected geographical points.

Exploring Tourism Cluster in the Peripheral Mountain Area Based on GIS Mapping

INTRODUCTION

Increasingly, developing tourism and making linkages with other economic sectors are strategically as a tool for regional economic development. In this article we will briefly resume and discuss the main results in the field of linkage between tourism and agriculture. In particular, we will survey the features of research area field data based on extensions of the linkage between tourism and agriculture on the several small agricultural settlements in Taiwan, which are the most relevant for mainstream application development. Finally, we will survey the currently available implementations of tourist spots by specified their locations on environmental conditions. Tourism in peripheral area is a relatively vulnerable to environment because of limited resource and disaster possibility. However, tourism provides alternative employment choice and greater economic inflexibility, so in peripheral area tourism development is still welcomed based on economic benefits. Clarifying the locational feature of the tourist spots is to realize the condition of tourism cluster, especially focus on the influencing factors of terrain conditions and accessibility. This research aims to explore the tourist attractions of a peripheral mountain area in the central Taiwan, analyze the important influenc-

ing locational factors of tourism cluster based on GPS (Global Positioning System) data of a set of tourist spots by processing GIS (Geographical Information System or Geographic Information System) mapping, and finally clarify what impacts the tourism cluster to the local environment by DTM (Digital Terrain Model) data.

BACKGROUND

The potential for creating synergistic relationships between tourism and agriculture has been widely recognized by development planners, policy makers. Commonly, economic leakage is the main factor for why the linkage of tourism and agriculture to promote local economic development in peripheral regions. Food is an essential component of tourism and also represents a significant part of tourism expenditure, and creating and strengthening the linkages between tourism and local food production sectors can provide a proximate market. The concept of “farm-to-fork” demonstrates the linkages between the dimensions of sustainable agriculture, sustainable cuisine and tourism by increasing demand for local products. Farm-to-fork concept also can lead to a range of related direct and indirect tourism activities such

as food festivals, farm visits, factory tours and souvenir food merchandise, thus further enhancing the benefits to the local (Berno, 2011).

Torres (2002) explores the linkages between tourism and agriculture in the Yucatan Peninsula, observes that the principal force driving hotel purchasing hotel food differences by tourist nationality and type of tourist based on tourist food consumption and preferences. So, in the Yucatan Peninsula Mexican foods, tropical fruits and organic produce are identified as this study area significant potential tourist food for linking tourism and local agriculture. Seaton (1999) examines tourism attraction in a peripheral region, identified critical success factors to small scale sustainable development, indicated that peripheral areas, distance from core areas with sparse populations and low GDP economic structure can motivate visitors to through some kind of special attraction such as book town for retailing. Gardiner and Scott (2014) investigates successful tourism cluster on the Gold Coast, Australia to develop the youth tourism market, through joint promotion and product development as an attractive destination. They propose that niche tourism clusters are often used to improve competitiveness to achieve economic advantages, through use of concepts of strategic alliances and networks. Cluster is therefore a fundamental factor to creating successful tourism industry within a destination zone.

Food supply chains of tourism accommodation providers in the coastal region of KwaZulu-Natal, South Africa, make the pro-poor tourism build of linkages between tourism and agriculture as a whole, and that revealing significant implications of tourist food consumption on destinations. Most research examining tourism and agriculture linkages has focused on hotel food procurement patterns while failing to address the main driving force of hotel purchasing tourist food based on tourist consumption and preferences (Pillay & Rogerson, 2013). The role of tasting room in the direct marketing of southwest Michigan wines educates visitors about Michigan wines, a way to differentiate the Michigan wines, and offers

spectacular views of fields, orchards is varied according to the different locations of the wineries. Commonly, these wineries all provide supporting services of cellar door sales and direct shipping for promoting local wine (Che & Wargenau, 2011).

The linkages between tourism and related sectors vary widely from nation to nation, region to region. There are numerous successful examples of strategic alliances between tourism and the agricultural related sectors in Taiwan, especially the Jhong-Liao Township, in Nantou County of central Taiwan. Jhong-Liao Township composes of several small agricultural settlements with a population of about 16000, is located on the elevation from 200 meters to 1264 meters. Jhong-Liao is not the most famous destination in Taiwan, but it is a popular mystery destination for its distant from urban area-Taichung City. During Ching Dynasty it was a stopping place of wildness space along a transport route from costal areas to mountainous areas of central Taiwan rather than a tourist spot. During Japanese Occupation Period (1895-1945) it was a high productive place of agricultural activity, planted in plenty of banana, so the reputation for Jhong-Liao is also called "Banana Mountain". 20 years ago, a visitor to the Jhong-Liao seemed to be a lonely trip into an empty mountain area, until 1999 there were almost no tourist spots in Jhong-Liao. It's famous for as a tourist attraction was traced to 1999, when an earthquake disaster dramatically destroyed here, an atmosphere of "Ghost Town" spread out in Taiwan. Since 1999 many tourists visited here to see the destroyed landscapes after earthquake, and the number of tourist spots in Jhong-Liao has increased to 70, so now it is transformed to one of most popular destination of Nantou County.

In recent years, the linkage between tourism and agriculture for environmental sustainability has been discussed as the development of alternative tourist food, which was perceived to be traditional and local agrarian products, appeals to the visitor's desire for authenticity within the holiday experience (Hall, 2005; Michael, 2007; Sims, 2009). Thus, tasting local food performs as an authentic

tourism experience that transforms traditional agriculture products to create cuisine culture of the destination. The significant implications of tourist food consumption on destinations have received a growing research interest recently (Telfer & Wall, 2000; Torres, 2002, 2003; Torres & Momsen, 2004, 2011; Pillay & Rogerson, 2013), and this means the linkage between tourism and agriculture has play important role in tourism development because tourism seems to help farmers to overcome economic growth constraints, upgrade and face new competitions in distant markets. Exploring the tourist consumption preferences is critical to the analysis of linkages between tourism and agriculture for creating either backward linkages to local agriculture or increased economic growth. Tourist consumption and demand for food vary greatly according to a number of factors, including tourist preference and type of tourist. Local food may be particularly popular with tourists because of its consideration of “iconic” products that capture the “typical” nature of a particular place. Local food is popular because it is associated with a host of value, and souvenir purchase is making local food as a symbol of place and culture (Sims, 2009).

GIS MAPPING WAY

The concept of tourism cluster has attracted attentions during the past decades, both as descriptive of an increasingly important strategy and an effective tool to enhance economic development in peripheral regions. This research used empirical data to explore the linkages of tourism, agriculture and religion for different implications both in terms of relevant evidence and the scope for promotional policies. In order to realize how many tourist spots clustering in this study area, this research locates tourist spots based on GPS data to collect data, and then specified all the points to raster layer of TWD 97 coordination system on GIS processing system. With elevation analysis, slope analysis, point density analysis, buffer analysis and overlay

analysis of GIS mapping way, this research aims to distinguish the significant association between the core clustering area of tourist spots and the influential factors such as environmental ones and accessibility. Finally, we conduct in-depth interviews of the holders of organic farmers, agricultural officers in government and the travelers visiting to Jhong-Liao, and defined there are 72 the total number of tourist spots, including:

- 38 religious temples,
- 14 organic leisure farms,
- 7 artificial landscapes,
- 6 natural sceneries,
- 5 mountain tracks, and
- 2 historical heritages.

Terrain Analysis of GIS Mapping

Hsueh (2013a) used terrain analysis of GIS mapping to specify a set of points based on the accommodations of a mountain area to compare the different percentages of accommodations on the different terrain conditions. Hsueh (2013b) also used terrain analysis of GIS mapping to explore the significant clustering area and locations of mushroom huts based on different terrain conditions in an agricultural mountain area. Hsueh (2015) analyzed the neighborhood of clustering area of a set of points of tea firms located on a plat form terrain by using terrain analysis of GIS mapping combined of related layers to process multiple buffer analysis to define the significant core area of tea firms clustering. This research aims to process terrain analysis to display the elevation and slope conditions of tourism cluster of tourist spots in the Jhong-Liao area. Jhong-Liao is a productive area of organic agricultural products in the central Taiwan. There are 14 organic farms in Jhong-Liao, thus Jhong-Liao has the advantage of tourist foods for its available for a lot of local organic foods, the most popular and favorite foods in Taiwan. As the representative agricultural products of oranges, longyans, bananas, it is obvious that Jhong-Liao has a lot of organic agricultural products, which

have converted to tourist foods to meet tourist consumption and preferences recently.

With many farmers switching to organic products of fruits, consolidation occurred in the organic agriculture as the number of Farm Alliance of Jhong-Liao increases gradually. It was not until 1999 that the He-Xing Organic Cultural Association created the “Original and Organic Cuisine” (OOC) whose purpose is to start to control the agricultural productive environment as well as ecology conservation and making health preserving cuisine as tourist foods based on local products. The linkages between tourism and agriculture become more apparent when we analyze what kinds of tourist foods and experiences tourists are seeking during their holiday. By telling the story of “vegetable dyes” in Jhong-Liao, it is possible to use the long scarf DIY activity of making tourist’s souvenir for authenticity to encourage the tourism development based on local agricultural products that will boost environmental sustainability and economic benefits. The experience of vegetable dyes with a particular focus on tourist attraction in Jhong-Liao is obtained from different local plant sources—roots, berries, bark, and leaves. Typically, the dye material is put in a pot of water and then the textiles tied with special techniques to be dyed are added to the pot, which is heated and stirred until the color is transferred. Without use of chemicals, the color of the vegetable dye is brilliant, permanent and with creative diversified local patterns, which is due to the different local plant sources such as:

- Betel nuts, Litchi, Longyan, and Tungoil Tree creating into light red shades;
- Cape Jasmine, Common Garcinia, kunyit, and onion into yellow shades;
- Chinese ixora, Subcostate Crape Myrtle, Kassod tree into green shades;
- Litchi, Longyan, rhus chinensis, and onion into brown shades.

By the interactions of cultivating technology of organic agricultural products through those

professional associations’ promotions, the tourist food reputation of Jhong-Liao thus enhanced. With their members concentrated in the same area, those professional associations are easy to share and offer professional knowledge to help the farmers in Jhong-Liao to establishment organic brand and organic certification. The tourism cluster of tourist spots strengthened the ties between tourism and agriculture providing for high quality and productive network of tourist food. There are a lot of agriculture related and supporting leisure farms co-located within the Jhong-Liao area to take an advantage based on close working relationships, and the cluster of leisure farms offers an empirical research of how tourism related sectors create competitive advantages. Organic farm holders, for instance, interact regularly with agricultural associations on tourist foods processing technologies and learn about how to promote tourist foods to visitors.

The notion of a new form of niche tourism has gone further than ever before. No longer is improved health on holiday or an escape from the routine work and the movement to a place with a cleaner climate, the rise of niche tourism has become the central theme of tourism in an active rather than a passive sense. The tourism literatures suggest there are different types in tourist attractions based on various characteristics of tourist spots. The important characteristics identified in the literature are tourist origin (Telfer & Wall, 1996; Telfer, 2001) and type of tourist (Sharkey & Momsen, 1995; Momsen, 1998; Telfer & Wall, 1996). Types of tourists range from the highly organized conservative mass tourist to the more flexible independent tourist. Most visitors who have the travel motivations to Jhong-Liao is triggered by religion, namely these visitors are flexible independent pilgrims by religion tourist attractions.

These diversity characteristics of the tourist spots locations enable comparisons based on elevation and slope conditions whether ‘suitable’ or ‘unsuitable’ tourist spots. Table 1 and Figure 1 show that all the total 72 tourist spots are near to

ivers and the popular elevation of tourist spots is located on an elevation < 300 meter accounting for 66% (48 tourist spots), 32% (23 tourist spots), while tourist spots on the area proximity to elevation > 600 meter is almost none. There are 27 tourist spots of 37% with a slope < 5%, 28 tourist spots of 39% with a slope 5%~15%, and 17 tourist spots of 24% with a slope 15%~30%, respectively (Table 2, Figure 2). Obviously, a flat slope is suitable for the management of tourist spots, beneficial to reach through an unfrequented mountain track for travelers, especially in a peripheral mountain area. Based on GIS mapping, we can realize terrain for tourist spots location is not only the main influencing factor in a peripheral mountain area, but also access to waters is becoming the important factor.

A cluster is a geographically proximate group of interconnected companies and associated institutions in a particular field, linked by commonalities and complementarities (Porter, 1990, p. 199). The local associations playing important role on Jhong-Liao's tourism cluster, such as Long-Yan-Lin Welfare Association, promotes the tourism image of North Jhong-Liao through the marketing network agriculture production through "organic brand" of the leisure farms; Farm Alliance of Jhong-Liao establishes banana market through the cooperation of banana farmers to promote Jhong-Liao's banana brand. Although the linkages of tourism and agriculture can result in higher levels of economic growth instead of becoming poor agrarian producers, it also contributes significantly to environmental impacts. There are 18 tourist spots of 25% with a slope < 5%, 31 tourist spots of 43% with a slope 5%~15%, and 23 tourist

spots of 32% with a slope 15%~30%, respectively (Table 3, Figure 3).

Apparently, several tourist spots located on unsuitable terrain condition because of its easy suffered natural disasters if there is heavy storm rain or typhoon. In Jhong-Liao, the high density clustering areas of tourist spots is apparent on the location with steep slope of slope > 5%, where is inclined to have debris flow disaster and slope land slide or collapse. Environmental control and resources conservation are essential missions for Jhong-Liao sustainable development on the tourism clustering process. The high-density clustering areas of tourist spots is apparent on the location with steep slope of slope > 5%, where is inclined to have debris flow disaster and slope land slide or collapse. Thus, slope factor may be an essential influencing factor for tourism development in peripheral mountain area.

Point Density Analysis of GIS Mapping

He and Gebhardt (2012) explore the spatial clustering of creative industries based on point density analysis of GIS mapping by locating the sites of creative industry parks to visualize the core area of creative industries cluster in Shanghai. To explore the tourism cluster of Jhong-Liao, this research also used point density analysis of GIS mapping to locate a set of points of the total 72 tourist spots, specified all the points of identified tourist spots' locations of TWD 97 coordination system. The obtained density surface of tourist spots distribution of Jhong-Liao by GIS mapping is essential to define the concentration center of tourism cluster.

Table 1. Number of tourist spots on different elevation condition

Elevation (Meters)	< 300	300 ~ 600	600 ~ 900	900 ~ 1200	1200 ~ 1500
Number of tourist spots	48	23	1	0	0
(Percentage)	66%	32%	2%	0%	0%

Table 2. Number of tourist spots on different slope condition

Slope	< 5%	5% ~ 15%	15% ~ 30%	30% ~ 40%	40% ~ 55%
Number of tourist spots	27	28	17	0	0
(Percentage)	37%	39%	24%	0%	0%

Figure 1. Spatial distribution of tourist spots -based on elevation condition

Figure 2. Spatial distribution of tourist spots - based on slope condition

Table 3. Number of tourist spots based on slope condition

Slope	< 5%	5% ~ 15%	15% ~ 30%	30% ~ 40%	40% ~ 55%
Number of tourist spots	18	31	23	0	0
(Percentage)	25%	43%	32%	0%	0%

The calculated method of point density value for comparing the extents of clustering of a raster surface is dependent on the estimating cell size and searching radius. On a point density surface, individual cell value is calculated by the specific point that falls within the searching radius. This research used 300 meter x 300 meter of cell size and 500 meters of searching radius to process the quantity of points per cell of each searching radius. By using point density analysis, we calculated the density value to explore the spatial concentration trends of tourist spots, and define the most concentrated zones of point locations of tourist spots, namely to distinguish the significant clusters of spatial distribution of tourist spots. With the point density surface of locations of the tourist spots, many layers such as DTM terrain raster, the transport raster, and the settlement raster can be overlaid together, and then the influencing factors of suitable locations accounting for tourism cluster render to be demonstrated.

In peripheral mountain area continuous monitoring on negative effects of tourism should be carry out and vulnerable sites should either be protected or visitors should be guided away from them. Micro-clusters are visible in some forms of tourism, where groups of tourist spots co-located and interact to deliver particular kinds of outputs, revealing that cluster is not confined solely to metropolitan areas but occurs also in peripheral mountain area. Hsueh (2012) used Porter's concept of cluster co-location for the example of tourism cluster by GIS mapping to locate a set of points of tourist spots along a route, clarified the core-periphery relationship among the tourist spots due to accessibility, and illustrated the core area

of tourism clustering due to the increasing tourist attraction of destinations drawing more and more visitors, while the relative peripheral area is undergoing marginalized through the spatial competition process. The conception of tourism cluster creating tourist attraction is also demonstrated by the antiques industry clustered in a mountain area as a trip generator and supporting sustainable form of economic growth (Michael, 2002).

Based on the point density analysis (searching radius 500 meter, cell value 300x300 meters), obvious cluster cores of tourist spots are identified (Figure 4). The areas with the most high point density value of between 10.18591615~12.73239517 are located on the west northern part and the west southern part of Jhong-Liao. Figure 4 also shows that accessibility is also an influential factor on the locations of tourist spots clustering. Apparently, the west southern part of Jhong-Liao, with the highest point density value, is not only due to the geographical proximity to urban area-Nantou City for providing more tourism related services but also convenient to leave Jhong-Liao through Route 139 to back home. Obviously, the representative tourism cluster districts, in the west southern part and west northern part of Jhong-Liao, agglomerate along the main linkages on the Route 139 and Route 22 reveals that accessibility still has a decisive role in terms of location selection.

Geographical proximity characterizes tourism cluster as collaborative network with strong competitiveness and significant opportunities to economic development, so the collaborative networks were especially important for Jhong-Liao's tourism development. Establishing a stable network of producers and generating external economies are also the premises of the local associations for promoting the tourism development for sustainability. Why tourist spots cluster along the main route – Route 22 and Route 139 of Jhong-Liao? Along a route is suitable for tourist spots because of visitors to access a tourist spot and the related supporting services of community, especially in a peripheral mountain area. Apparently, tourist spots also clustered on the neighborhood of settle-

Figure 3a. Spatial distributions of the tourist spots based on slope condition

ments because settlement serve as the function of community by providing related supporting services, especially in a peripheral mountain area with confined activity space. There is considerable evidence that it is efficient for tourist spots next to community to access tourism services based on

point density analysis by GIS mapping. So, access to community may be the basic factor for Jhong-Liao's tourism cluster. There are several tourism related networks in the community between tourism associations and agriculture activities. The professional tourism associations tourism of

Figure 3b. Spatial distributions of the tourist spots based on slope condition

Jhong-Liao were established from 1999, such as Long-Yan-Lin Welfare Association, Dab-Hand Vegetable Dye Workshop, Xi-Di-Yao Agriculture Learning Garden, He-Xing Organic Cultural Association, Kan-Ding Cinnamon, Making Wine Specialized Garden, and Long-An Medicinal

Botanical Garden. One of the reasons for those professional associations playing important role on the process of tourism cluster is their creative knowledge on shaping tourist attractions and related support service networks between tourism and agriculture for segment market of niche tour-

ism. For example, there are common facilities for vegetable drying, fruit-picking tools shared by the small workshops or leisure farms or education providing by professional associations, which also offers agriculture information to members.

ment efforts in this direction by GIS mapping are required in the next further research.

G

FUTURE RESEARCH DIRECTIONS

Future research should follow the direction of a location extension of spatial data base and analysis way in GIS mapping with advanced aspects in the linkage of tourism and agriculture implementations, including, for instance, which location is suitable for developing tourism based on agriculture products. Implementation of the tourist foods and their marketing integration with government sectors have not performed yet, so further pulling forces for the tourist foods marketing and develop-

CONCLUSION

In this article, we reviewed some of the most prominent theoretical results and practical achievements of research in the GIS mapping field. Although the ways of GIS mapping applied to the linkage between tourism and agriculture have been studied, we focused on the terrain analysis including elevation condition and slope condition and point density analysis, discussed their main features and surveyed their emerging implementations on tourist spots in the study area. Based on GIS mapping way, we realize the promoting of tourist attractions is not only by tourism cluster of tourist spots but also by linkages between tourism and

Figure 4. Point density analysis of tourist spots

related and supporting sectors such as agriculture. Linkage between tourism and agriculture makes a destination easier to shape its destination image, establish tourism activity network, and segment market. Most related literature reviews about tourism cluster focus on cluster benefits as the key elements of analyzing optimal location, but this research focuses on environmental impacts of tourism cluster for small scale tourist spots in a peripheral mountain area, reassesses the role of micro tourism cluster, like the leisure farms distinguished by organic agriculture and religious tourist spots, as tourist attractions of peripheral tourism. Instead of focusing on the benefits or patterns of tourism cluster, this research explores the environmental impacts of tourism cluster in a fragile mountain area, examines terrain factors of elevation and slope by GIS mapping way to realize how tourism cluster is influenced and further emphasize tourism cluster promoting peripheral area economic.

KEY TERMS AND DEFINITIONS

DTM: A digital representation of ground-surface topography or terrain represents the bare ground surface without any objects like plants and buildings. DTM is a topographic model of the bare earth-terrain relief that can be manipulated by computer programs. Vegetation, buildings and other man-made artificial features are removed digitally-leaving the underlying terrain. The data files contain the spatial elevation data of the terrain in a digital format which usually presented as a rectangular grid, and can further be transformed to visualize slope, aspect and viewshed conditions of the terrain.

Elevation Analysis: An analysis way of terrain based on GIS mapping. Elevation analysis can perform certain analytical tasks quickly and easily, without having to collect or update an authoritative set of base data. Elevation analysis is essential for many GIS applications example for natural resource management, conservation, agriculture, transportation, risk management.

GIS Mapping: A method of digital mapping and a technology that offers different tools in which we produce and use the maps to manage our communities and industries. GIS creates intelligent super maps through which sophisticated planning and analysis can be performed based on the transformation of spatial locations of real-world features and visualize the spatial relationships among them.

GIS: A system designed to capture, store, manipulate, analyze, manage, and present all types of spatial or geographical data. GIS tools allow users to create interactive queries, analyze spatial information, edit data in maps, and present the results of all these operations. GIS can specify locations or extents in the coordinate system recorded as dates/times of occurrence, and x, y, and z coordinates representing, longitude, latitude, and elevation by using location as the key index variable.

GPS: A satellite-based navigation system made up of a network of 24 satellites placed into orbit by the U.S. Department of Defense. GPS was originally intended for military applications, but in the 1980s, the government made the system available for civilian use. GPS works in any weather conditions, anywhere in the world, anytime in a day.

Point Density Analysis: A tool of GIS mapping that can calculate the density of point features around each output raster cell. A neighborhood is defined around each raster cell center, and the number of points that fall within the neighborhood is totaled and divided by the area of the neighborhood. Possible uses include finding density of disease cases, crime cases, or firms clustering. For example, one address might actually represent a crime case, or some crime cases might be weighted more heavily than others in determining crime rates. Increasing the radius will not greatly change the calculated density values. Although more points will fall inside the larger neighborhood, this number will be divided by a larger area when calculating density. The main effect of a larger radius is that density is calculated considering a larger number of points, which can be outside from the raster cell.

Slope Analysis: An analysis way of terrain based on GIS mapping. Slope analysis calculates the maximum rate of change between each cell and its neighbors, and the maximum change in elevation over the distance between the cell and its eight neighbors. Every cell in the output raster has a slope value. The lower the slope value, the flatter the terrain, while the higher the slope value, the steeper the terrain. In GIS mapping, slope analysis is very important for suitability analysis and predicting potential hazards. Analyzing the terrain slope of a given location plays an important role in the research of flood disaster, site planning, and conservation.

Geographic Information System (GIS) Modeling Analysis and the Effects of Spatial Distribution and Environmental Factors on Breast Cancer Incidence

Akram Gasmelseed

University of Science and Technology, Sudan

Ali H. Alharbi

Qassim University, Saudi Arabia

INTRODUCTION

Breast cancer is a major health issue in all countries affecting thousands of women (Tazzite et al., 2013; Dube & Gupta, 2015). So far its cause(s) are unknown and the national and international strategies to reduce its morbidity and mortality levels are based on early detection of cancer through screening and treatment according to clinical guidelines. Thus, knowledge of which women are at risk and why they are at risk is therefore essential component of disease prevention and screening. Researchers from the International Agency for Research on Cancer (IARC) and the World Health Organization (WHO) reports that globally breast cancer might contribute to the greatest burden on women's health when compared to other cancer sites (World Health Organization, n.d.). In 2015, an estimated 231,840 new cases of invasive breast cancer are expected to be diagnosed in women in the United States, along with 60,290 new cases of non-invasive (in situ) breast cancer (Siegel et al., 2015). However, all locations are not equal for breast cancer risk and thus support a major role of the geography in breast carcinogenesis (Akram & Nanna, 2003).

The purpose of this work is to provide a more detailed analysis of the breast cancer distribution in the United States by comparing the spatial distribution of breast cancer cases against

physical environmental factors using Geographic Information System (GIS) (Figure 1). Further, it gives background information to the GIS and its applications in health-related research.

BACKGROUND

Breast Cancer Facts/ Spatial-Based Patterns

Previous reports have shown that the Northeast United States has a 16% higher breast cancer mortality rate than the rest of the country (Kulldorff et al., 1997). The probability of breast cancer risk is not equal for all locations which indicate that geography plays a very important role in the etiology of breast cancer.

There are geographic patterns of high cases of breast cancer, and the analysis of these patterns is very important in the formulation of hypotheses about risks and focus investment more effectively in research and intervention on the most significant areas (Laden et al., 1997).

In general, breast cancer incidence rates have continued to increase since 1980, although the rate of increase slowed down in the 1990s, compared to the 1980s (American Cancer Society, 2004). Furthermore, during the more recent time period, breast cancer incidence rates have increased only

Figure 1. medical-based GIS

in those aged 50 and over. The mortality rates declined by around 1.4% per year during 1989-1995 and by 3.2% afterwards, with the largest decreases in younger women in both whites and African Americans. These decreases are probably due to the result of both earlier detection and improved treatment. Clearly, the ultimate cause of breast cancer is unknown (Roche, 1998), but several risk factors appear to play a role.

Previous literatures have shown that breast cancer mortality and incidence rates vary geographically according to the different regions of the United States (Devesa et al., 1999; Joseph et al., 2004). Generally, the disease is most common in North America and Western Europe, account for about one in four female cancers in these regions, while in the Far East (China and Japan) it is very much rare (Le et al., 2002). Furthermore, the disease rates among Asian-Americans are lower than those of U.S. whites but considerably higher than rates prevailing in Asia. Thus, it is suspected that migration to the US brings about a change in endocrine function among Asian women, although

reasons for this change remain obscure (Wu et al., 1996). In fact, the geographic patterns of cancer around the world and within countries have provided important clues to the causes of cancer (Robert, 1996). The highest incidence rates of all are found in Hawaii, where a rate of 93.9 per 100,000 female populations has been reported, and in US white women. The incidence rises with age from about age 30. Moreover, there are ethnic variations, such as a high incidence in Israeli Jews compared with non-Jews in Israel. It is more common in single women, in higher social classes, and in urban rather than rural areas. On the other hand, about 1% of cases occur in males. Mortality has increased less rapidly than incidence, but breast cancer is most common cause of cancer death.

What is Geographic Information System (GIS)?

Maps are well-known to be one of the most used visual tools in our life today. They have very long tradition and they have been used from ancient

time. They are very useful tools to visually show a place and its features. However, maps, at least in their traditional form, have limited capabilities in the amount and type of information they can depict. In addition to this, the capability of human processing of huge information is limited. Gathering information from different sources, integrate, analysis, and interpret them is a complex and time-consuming task.

Data visualization is one of the areas that have been improved due to the adoption of new technology and visualization frameworks and systems. Advancement in information technologies has affected each aspect of our daily life. Data integration, processing and visualization are no exception. Today, intelligent computerized tools are available to help users enter and process information effectively and efficiently. The capability of computer systems in processing and make sense of data is improving dramatically in the last few years. Data visualization is the branch of information processing that deals with finding ways and methods to present data using various visualization techniques in order to make it easy for the users to interpret and make sense of the data.

One of the general and most comprehensive definitions of GIS is the one provided by ESRI (Environmental System Research Institute) (GIS dictionary, ESRI, n.d.), in which GIS is described as:

An integrated collection of computer software and data used to view and manage information about geographic places, analyze spatial relationships, and model spatial processes. A GIS provides a framework for gathering and organizing spatial data and related information so that it can be displayed and analyzed.

This definition stresses the fact that GIS is more than just the technology behind this system, but it is actually a comprehensive framework to support decision making by the integration of spatial data and other factors using visualization techniques.

(GIS) can be defined as:

A collection of science and technology tools used to manage geographic relationships and integrate information. GIS helps us analyze spatially-referenced data and make well-informed decisions based on the association between the data and the geography.

Applications of GIS in Health Science

Applications of GIS in health science have increased dramatically in the last few years with many innovative approaches have emerged. Understating the relationship between health and contextual factors, such as sociodemographic, environmental and political variables, can be complex. GIS can facilitate the integration and presentation of these contextual variables to gain insight into their influence on health. This section reviews the research related to the use of GIS to improve health care.

A previous study conducted a review that focuses on the applications of GIS in public health and health promotion (Nykiforuk & Flaman, 2011). The final review was composed of 621 journal articles and book chapters reporting health-related applications of GIS. According to the review, GIS applications in public health can be classified into four main themes: disease surveillance, risk analysis, health access and planning, and community health profiling. Moreover, some other reviewed literature on the applications of GIS in health science research (Lyseen, et al., 2014), and present a conceptual framework that can be used to better categorize and understand research in this area, and thus put emphasis on areas that need further research. The sample size of the study consists of a total of 865 articles pulled out from the research databases Scopus and Web of Science. By applying ground-theory data analysis method, the study presents a framework that comprises four conceptual domains to represent GIS applications in health science. These domains are:

- Spatial analysis of diseases,
- Spatial analysis of health service planning,
- Public health, and
- Health technology.

Disease Surveillance

One of the most well-known applications of using GIS in public research is for disease surveillance, which is the integration and tracking of data related to the incidence, prevalence, and the spread of the disease in the community. Epidemiology seek to answer basic questions such as when and where are cases of an infectious disease currently occupying, can we predict the next occurrence of the disease, and how can we prevent the spread of the disease? GIS can help increase the speed and occurrence of finding answers to epidemiology these questions by integrating spatial information on the disease with other types of geographic information to track and map the spread of the disease (Eisen & Eisen, 2014).

Research in this area can be classified into two interrelated categories: disease mapping and disease modelling. Disease modeling is the extension of GIS capabilities to support the decision making process. It can be applied to the data to (a) predict the outbreak of a disease, (b) identify Planning of Healthcare Services Literature reported differ-

ent ways of applying GIS technology to support decision making in the planning and distribution of healthcare service.

Strategic planning is required to achieve optimal and demand-based distribution of healthcare centers. An example, GIS was used to assess hospital distributions in Seoul, the capital of South Korea (Lee & Moon, 2014). The study proved that GIS can be used to identify and examine the factors that influence health service distribution.

In developing countries, planning and delivery of healthcare services can be critical. Brijnath and De Souza (Brijnath & De Souza, 2012) discussed different ways in which GIS can be utilized to enhance health service planning and delivery for infectious diseases in low-income countries. according to the paper GIS be used to:

1. Get insight into the optimized locations for distribution healthcare centers,
2. Provide real-time surveillance system for the control of diseases,
3. Serve as an evidence-based accountability tool between funding agencies and healthcare provides, and finally
4. Transform data into accessible format to make it easy for stakeholders to make informed decisions.

Figure 2. Female breast cancer mortality (1994-98) rate by state

METHODOLOGY

In this research we obtained mortality estimates (Figure 2) in 50 states of the United States from the National Center of Health Statistics (NCHS) for the years 1994-98 (National Cancer Institute, n.d.). We excluded those states for which the corresponding data was not available.

The environmental factors used in the analysis were limited to seven spatial environmental factors collected from NSTATE, LLC (United States Geography, n.d.). In this work Regression analysis have been used to detect and evaluate the statistical significance between the mortality rates and the spatial environmental factors.

RESULTS

Preliminary results show an inverse relationship between the death rates and mean elevation ($T = -6.25$; $p = 0.000$) and positive relationship with the average temperature ($T = 3.07$; $p = 0.004$). The high F-value 21.71 and low p-value indicate there is a statistically significant difference between mortality rates and the selected spatial environmental factors. The differences are certified as statistically significant and are probably not due to sampling variability only. All the relevant finding related to the explanatory power of the independent variables, in the goodness of fit of all possible models can be enhanced by looking at the best-fit models with the significant (at the 5% level, $p \leq 0.05$) explanatory underlying variables, for each of the mortality/incidence pattern groups according to the spatial environmental factors (Table 1 and Table 2).

DISCUSSION

Effect of Average Temperature on Breast Cancer

Temperatures cause a variety of physiological changes, e.g. of blood composition, blood pres-

sure (Stout & Crawford, 1991) and circadian rhythms (Reiter, 1991), which in turn are believed to contribute to an increased mortality/incidence of breast cancer (Kliukiene et al., 2001). Furthermore, published laboratory studies have reported that melatonin might have cancer-preventive activities (Coleman & Reiter, 1992). Moreover, melatonin has been observed to exert potent inhibition on cancer growth by acting as natural anti-angiogenic molecule, with a following opposition or angiogenesis-dependent cancer proliferation (Lissoni et al., 2001). This has been demonstrated in certain human breast cancer cell lines such as MCF-7, with additional in-vivo effects on breast oncogenesis in various rat models. Melatonin (N-acetyl-5-methoxytryptamine) is a hormone secreted by the pineal gland of vertebrates, which controls several physiological functions associated with circadian rhythm (Becker-Andre et al., 1994). Temperature is a major regulator of circadian rhythms. Circadian rhythms control many physiological activities. Synchronization of biological

clocks to environmental time is adaptive and important for physiological homeostasis and for the proper timing of species-specific behaviors. A number of investigations have been conducted to examine the effects of temperature and light on melatonin rhythms (Underwood & Calaban, 1987). Based on our analysis, we proposed a second order equation ($y = a + bx + cx^2$) to describe the correlation between the average temperature and mortality rates as this model seems to be the one that best describes the relationship between the two parameters. Hence, based on this model, the estimated temperature (T_e) values at which the mortality rates are low is in the range $49 < T_e < 11^\circ\text{C}$.

To further examine the idea that temperature can influence breast cancer rates, we tested the relationship (if any) between mortality rates and geographic coordinates: latitude and longitude.

Clearly, the principal controls of temperature variations are latitude and elevation (altitude). The latitude for a given point on the earth has an effect on temperature; the farther away from the Equator (0°) a point is the cooler average temperature that point is likely to have. We obtained worldwide breast cancer mortality statistics from WHO Cancer Mortality Database, WHO/IARC (WHO Cancer Mortality Database, n.d.). Then, we investigated the possible correlation between the geographic coordinates of the countries and the age-specific rates (ASR) of breast mortality. The result revealed that there is existing negative relationship between latitude and mortality rates, i.e. by increasing latitude the death rate increases. Variations in latitude lead to variations in the temperature and sunlight intensity and hence for disturbance of melatonin rhythms. A previous report, investigators showed evidence for a link between cosmic ray intensity and cancer due to variations in the latitude (Juckett & Rosenberg, 1997). Moreover, it was demonstrated that light-induced melatonin suppression in humans is sensitive to short wavelength light (420 – 480 nm; $I_{\max}$ @ 460 nm) (Skene, 2003).

Jet Lag and Circadian Rhythm

Investigators reported that “Jet Lag” is caused from air travel through changing time zones, and hence leading to disturbance of melatonin rhythms (Samel & Wegmann, 1997). The main but not only cause of jet lag is crossing time zones. Usually going east is worse than going west (Delagrangé & Guardiola-Lemaitre, 1997). Finally, the obtained negative relationship between mortality data and elevation is clear in the sense that reduced temperature occur at higher elevation where there is less water vapor to trap and hold heat (Figure 3).

Further, we found a large, significant relationship between women at ages 30-74 and the

Figure 3. Influence of “jet lag” on breast cancer development

geographic latitude. For women aged 65 years and older, breast cancer mortality is 26% higher in New England than in the south, while incidence is only 3% higher. Mortality rates from breast cancer are approximately 25% higher for women in the northeastern United States than for women in the South or West. This can be depicted by the correlation with the geographic longitude, see Figure 3. Investigators reported that “Jet Lag” is caused from air travel through changing time zones, and hence leading to disturbance of melatonin rhythms.

The exposure to some spatial environmental factors seems likely to have a major impact on the overall trends in breast cancer rates. The possibility to develop cancer is existing naturally through the environment factors. Unbalanced in these nature factors and/or other existing risk factors, e.g. socioeconomic conditions will increase the chance for cancer development (Figure 4).

Figure 4. Role of spatial environmental factors in breast cancer development

FUTURE RESEARCH DIRECTIONS

The results presented in this work need to be elaborated based on the latest advancement in information technology. Hence, for future research, our goal is to incorporate cutting-edge information technology services to increase our understanding of variations in the breast cancer disease and geographical factors, to describe the disease burden, and to obtain guidance on the action to be taken.

Cloud computing is one of the cutting-edge technologies that may be feasible in the future. Thus, the integration of GIS with cloud computing technology can provide new insights into breast cancer research by providing shared information through internet.

Moreover, adopting such approach could maintain a reliable data as well as device and location independency.

CONCLUSION

We have combined data and techniques from the areas of environmental physics and cancer epidemiology to explore the hypothesis that spatial environmental factors can induce changes in melatonin rhythms, which can lead to increases in breast cancer rates. The results are interpreted as evidence that temperatures can modulate cancer via changes induced in melatonin rhythms.

Results show that the exposure to some spatial environmental factors seems likely to have a major impact on the overall trends in breast cancer rates. Moreover, the possibility to develop cancer is existing naturally through the environment factors.

Furthermore, this study provides valuable reference information for clinicians and health administrators, as well as baseline for more detailed studies of patient survival for individual environmental/geographical sites. The earlier the cancer is detected, the smaller the chance that it already has spread beyond the limited primary focus. This

implies that the extend of intervention needed is lesser and the prognosis improved.

Finally, map-based exploration of georeferenced health statistics will lead to a better understanding of health/environment interaction. By utilizing geographical information system technology we can enhance our ability to manage, estimate and predict breast cancer distribution.

KEY TERMS AND DEFINITIONS

Breast Cancer: It is tumor growth that starts in the cells of the breast. The disease occurs almost entirely in women, and it can affect men as well.

Circadian Rhythm: A description of physiological and behavioral patterns altered within 24 hours.

Geographic Information System (mGIS): It is defined as computer-established information system that is particularly designed to view and manage information about geographic places, analyze spatial relationships, and model spatial processes.

Incidence and Mortality Rates: Are defined as how many people get and die from breast cancer respectively.

Jet Lag: It is a medical condition which results as consequence of alterations to circadian rhythms due to long hours of travel.

Medical-Based Geographic Information System (mGIS): It is defined as GIS applications and the related medical data for monitoring and analyzing medical risk factors associated with the spatial environmental factors.

Regression Analysis: It is a statistical tool for estimating the relationships between variables.

INTRODUCTION

One of the main challenges of the 21st century are caused by the large amount of geospatial information through a GIS. Throughout time there have been many attempts to define Geographic Information Systems (GIS). Yet there is no consensus on define it and restrict it to one definition is limited. In the acronym - Geographic Information Systems - the geographic refers to the Earth's surface and near-surface, therefore, all human production and activity, and non-human are possible spatialization in GIS.

GIS is recognized as an analytical and decision-making tool with many uses in different fields. Likewise it is used in many industries plus commercial, education or government. It is powerful for

- Land administration,
- Statistical mapping,
- Transport,
- Network and environment management,
- Remote sensing images,
- Water/waste management,
- Maintenance and management of public lighting,
- Regional and urban planning,
- Tourism planning,
- Healthcare planning, and in
- Crime and security management.

In broad terms GIS is a special class of information systems that keep track not only of events, activities, and things, but also their location. Computerization has opened a vast new potential in the way people communicate, analyze our surroundings and take decisions. The available data represent layers of the real world that can be stored, processed and presented later to answer future needs (Bernhardsen, 2002).

In the process of acquisition, processing and spatial representation there is the involvement of a multiplicity of inputs and outputs that can be managed on databases, which invariably seek analytical and graphical spatial embodiments. In the graphical display, vector or raster elements can be chosen, depending on the degree of specificity of the database and the type of expected results.

These databases can be collected at different scales and using a plurality of data types, including population census, aerial photography or satellite imagery. It allows to address multiple operating phases of the planning management process in a multiscale perspective with the challenge to meet more effective and efficient solutions. Due to this, nowadays it is frequently used as a spatial decision support system (SDSS) (Crossland, 2005).

Well-designed GIS should be able to provide a good computer system, because traditional GIS are intended to users operating on local servers. Traditionally GIS includes hardware and software. The hardware are the physical parts of the

DOI: 10.4018/978-1-5225-2255-3.ch301

computer itself and associated peripherals (e.g., plotters and printers); and the software is interoperable, supporting the many data formats (in the infrastructure life cycle) and implementation may be custom-designed for an organization.

Even so a GIS can have two types of groups typically called as “GIS carries” and “GIS users”, which are respectively responsible for the management and analysis. The heart of GIS technology is the ability to conduct spatial analysis, overlay data and integrate other solution and systems. Geoprocessing operations facilitate to link or merge data, spatial characteristics of data; search for particular characteristics or features in an area, update data quickly and cheaply and model data assess alternatives (maps, graphs, address lists, reports and summary statistics) tailored to meet particular needs.

Nonetheless GIS feature a number of operational advantages and have allowed the proliferation of new fields of endeavor in open access systems across multiple forms of acquisition, management, interpretation and spatial information analysis. This can be seen in the first item of the present paper where the background and GIS starting point is explored. The main goal of this paper is to underwrite the concept of GIS evolution and to identify new paths to accommodate recent scientific approaches with extensive range of application possibilities.

THEORETICAL BACKGROUND: THE STARTING POINT

GIS is the advent of a new stage of cartography. The evolution of this type of system is relatively recent, between the 50s and 60s of the XX century, but knowledge and technology have grown rapidly recently. The emergence of technological systems with computerized cartographic application arose from the need of the resolution of certain military problems and public administration domains. Many contributors and diverse influences concerning concepts and principles, data and issues

of spatial infrastructure, software vendors, application areas, allowed a cohesive growth (Figure 1). GIS organizational structure is as diverse well as the multitude of roots from which it originated multitude of proprietary and public domain GIS software packages (Hendriks, 2005). Nowadays, applicability of this type of systems widened for commercial, non-profit and academic areas.

The mid 1960s witnessed the initial development of GIS in combining spatially referenced data, spatial data models and visualization. The actual roots of GIS are complex and difficult to determine (Miller & Goodchild, 2015).

Most authorities cite the Canada Geographic Information System (CGIS), designed around 1964, with a project led by Tomlinson (Bruno & Giannikos, 2015; Mordechai et al., 2008; Tomlinson, 1967). The objective was to obtain means for summaries and tabulations of areas of land from the Canada Land Inventory. For the registration of this lands, was made a massive federal-provincial effort to assess the utilization and potential of the Canadian land base. CGIS arose from the need to answer the challenges to measure accurately the areas of irregular geographic patches of homogeneous utilization and to overlay/compare different themes (Goodchild, 2006).

The period of the 1970s was characterized by rapid evolution, and ability of computer mapping automatic using data format and the solution of a wide range of technical issues. In the 1980s, democratization of access to computer allowed expand use of GIS. These innovations led to the first commercial viability of GIS, started to become popular as a standard computer application in government departments, universities, and private corporations. Accordingly, the ability to select, sort, extract, classify and display geographic data on the basis of complex topological and statistical criteria was available to users (Goodchild, 2006; Pourabbas, 2014).

The 1990s saw map analysis and modeling advances in GIS, and these systems became real management information tools as computing power increased. During this decade, the Open

Figure 1. Timeline of major GIS events, Source: Authors' own elaboration

GIS Consortium (OGC), aimed at developing publicly available geoprocessing specific actions, was founded. OGC is an international industry consortium, including government agencies and universities.

In 2000, the advent of web 2.0 and, more recently, the Web 3.0 (the semantic web) allow the Open Source GIS growth. Open source is a software that allows code source access to be open and free to distribute and modify. Nowadays it is possible for programmers to add new functions very rapidly and cheaply due to recent GIS advances. Mobile and internet devices, cloud computing, NoSQL databases, Semantic Web, Web services offer new ways of accessing, analyzing, and elaborating geospatial information in both real-world and virtual spaces, both for open source and commercial GIS (Pourabbas, 2014).

Despite the progress made during the twenty-first century, there are numerous challenges still lay ahead for geospatial sciences in various fields as shown in Table 1 (Yue et al., 2013).

DATA ANALYSIS AND TREATMENT SYSTEMS

Common citizens are constantly interacting with spatial dimension. Thereby, a GIS can be defined as a computer system operated by people, which comprises different aspects to be efficiently oper-

Table 1. The challenges for geospatial sciences for types of data intensity

Intensity	Description
Data	Collect of a multitude of data from space by day and accumulation at a similarly high rate.
Processing	Intensive modes of processing information in different spatiotemporal spectra.
Competition	Action of a multitude of end users accessing parallel to information (reception of a large number of users simultaneously are possible, because of development of the several services (e.g., Google Maps and Bing Maps).
Spatiotemporal	Set of spatial and temporal dimension. It can be distinguished into two types of information – dynamic or static.

Source: (Adapted from Yue et al., 2013.)

ated. Firstly, a GIS have the hardware, software and data components. Those multidimensional components can be articulated to give us the basis to develop spatial analysis. However human interaction is crucial to develop a conceptual model approach, plan, operate and analyze the information. Nowadays a GIS can be very helpful to different enterprises size, organizations and persons where geographic patterns can be modelled and predicted. Spatial/Geographical data is representing real world through layers or objects where spatial position is crucial. Typically geographical data have descriptive or spatial information (Faiz & Krichen, 2012). It can be used to represent discrete data, typically through a vector-based representation (points, line polygons), or as a continuous data through a cell-based or raster mode that uses a matrix representation.

The most interesting part of a GIS project is the Spatial analysis (Heywood et al., 2011). It is related with the capability to visual analysis of maps and imagery, computational analysis of geographic patterns, finding optimum routes, site selection, and advanced predictive modeling (ESRI, 2013:6). The world is complex, but the exponential growth of technologies, such as Global Position Systems (GPS), real time-sensors or GIS made possible there simplification (ESRI, 2013). GIS are efficient tools for recording, exploiting, analyzing and displaying geographical data that can be applied in:

- Transportation,
- Health, environmental,
- Urbanism,
- Political activities,
- Water/waste management,
- Geomarketing,
- Security,
- Tourism,
- Viticulture/enology,
- Education or
- Crime.

This broad kind of applications covering private and public sectors are growing exponentially. Open-source and proprietary software development have been contributing to this development due to its recent growth and attention.

Aside the raster and vector in spatial modelling more recently three and four-dimensional data is being investigated (Lin et al., 2013). Virtual Geographic Environments (VGEs) interest are growing faster in last years. It is characterized as being a bridge between the three scientific requirements of Geographic Information Science: multi-dimensional visualization, dynamic phenomenon simulation, and public participation (Lin et al., 2013).

GIS TRENDS

Currently, the key trends that face in GIS concerns are geospatial web, GIS in the cloud, space-time GIS, augmented reality and real-time GIS. Web-based in GIS combines information systems and geographic web technology (Chakraborty et al., 2015). Web GIS is a paradigm shift from a model based on national governments as major players in the production of geospatial data to one based on the collaboration between citizens and private institutions (Goodchild et al., 2007; Grossner et al., 2008). The enhanced participation of different actors in the generation of geospatial data, it is increasingly difficult to distinguish the producers and users (Budhathoki & Nedovic-Budic, 2008), mainly due to the free software and open source tools availability (Crampton, 2009). Due to the opening of the GIS world to a multitude of actors involved in the mapping data and Web GIS tools, refers to ads to meet end-user needs (Elwood, 2009). GIS based on the web are accessible not just from a computer but also on different multiple devices, including laptops, smartphones or tablets (Chakraborty, 2015).

The opening of the source code and the use of free software aims to contribute to greater

openness to collective voluntary participation in the use, study and modification of the software (Chakraborty et al., 2015). In the beginning of the 21st century started an innovative and leading geolocation-based service of crowdsourcing at a massive scale named as Open Street Map project (OSM). This project improves Volunteered Geographical Information' and aims to create a free digital map of the world. Those collaborative platforms are empowering citizens to create a global patchwork of geographic information (Goodchild, 2007; Mordechai Haklay, 2010). The international non for profit Open Geospatial Consortium was founded in 1994. It is an international voluntary organization that led the standards development process for geospatial and location services (Haklay et al., 2008). Among the three most relevant standards OGC include: Web Feature Service (WFS), Web Map Service (WMS) and Web Coverage Service (WCS) (Giuliani et al., 2016; Parker & Dominguez, 2015).

This new forms of utilisation of GIS on the web environment using a distributed and asynchronous requires a client-server architecture (C/S). This is characterized by a client request of a service, such as mapping, decision analysis, data processing or storage data while the server provide the service (Mekonnen & Gorsevski, 2015). Web GIS exits benefited by providing the best agents solutions to problems that traditional GIS (Chang & Park, 2006). More recently Web-GIS has become to a cloud GIS, based in model of "Software as a Service" (SaaS) (Kerski, 2015).

Cloud computing are increasingly widespread and make possible to run cloud applications in a shared data center accessed by internet. The emergence of GIS in the cloud solved the problems associated to the increase of precision and spatial-temporal scope of information. In general, there are an accumulation of multitude data records and this dataset has varied at a daily rate (Hey, 2012) and allows network access to a set of configurable data (servers, storage, applications and services) (Yang et al., 2011). The recent

emergence cloud GIS provides the ability to build a GIS service enabled for use in the cloud and can be made to scale up or down according to user needs. GIS cloud is equipped with new models of maintenance and use of geospatial data for a variety of users and to solve computing problems (Yu et al., 2014). This service provides users the ability to act in the manner of 'pay-as-you-go'. This mechanism of action has been a dream for several decades and has recently become a reality (Armbrust et al., 2010).

The cloud GIS has several characteristics namely: (i) it is not necessary to provide a software installation; (ii) not to use the computer's internal space for data storage; (iii) enable a collaborative action between different actors (flexibility); (iv) adapting services to demand and actual charge; (v) enhancing greater interoperability between various source code; (vi) decrease the time taken by decision-makers to implement processes of deliberation and (vii) the implementation of the entire system in a top-down scale (Armbrust et al., 2010; Blower, 2010; Yu et al., 2014). Cloud computing is a powerful technology that enables greater profitability in energy consumption and economic resources (Buyya et al., 2009; Lee & Chen, 2010; Marston et al., 2011). It perform massive-scale and complex computing and eliminate the need of maintain software, hardware or dedicated space (Assunção et al., 2015; Hashem et al., 2015).

Associated to this is the massive growth of generated data scale and volume which is challenging and time demanding tasks to ensure data processing, analysis and store (Hashem et al., 2015). Concerning to this Big Data concept is emerging and specified the four Vs, namely,

- Volume of data,
- Variety of data collectors,
- Velocity of data transfers, and
- Value process of discovering huge hidden values from large datasets (Gantz & Reinsel, 2011; Hashem et al., 2015).

The advancement of these technologies can enable the construction of spatial data infrastructures (SDI) and cyberinfrastructures (Schäffer et al., 2010; Yang et al., 2010). Some public cloud computing platforms are already available, including Microsoft Azure, Google App Engine or Amazon EC2. In any case a cloud can be public or private. The public cloud is available to the public while the private cloud is only used within an organization.

Cloud computing includes multiple domains, such as energy and mineral sciences, weather, traffic and simulation management systems, landscape ecology, water management, disaster management or human and environmental health (Yang et al., 2013). According to these authors the main obstacles to the success of cloud GIS are associated with policy, management, acquisition and operational requirements. Forward-looking multiple threads are identified:

- Cumulative advances for interdisciplinary approach, abreast of progress in geoscience and digital earth;
- Cloud interoperability based on standards (OGC, OGF, NIST, ISO, IEEE) and through a systemic architecture;
- Integration of innovative interaction systems for viewing and access;
- Real-time simulation for decision support;
- Security levels set to a deployed computer with a platform with distribution of certain information and the collaboration by integrating multiple platforms, and in view of the scope of science for the citizen, technology to crowdsourcing, dynamic events and challenges of education.

Another type of evolution in GIS is linked of framework of Hägerstrand (space-time model). In this context, the space-time studies the individual patterns, considering the various constraints in a particular spatial-temporal environment (Hägerstrand, 1970; Hägerstrand, 1989). There have been a number of efforts to ensure the incorpora-

tion of concepts in a GIS (e.g., Goodchild, 2013; Miller, 1991; Neutens et al., 2007; Shaw & Yu, 2009). This system presents a three dimensional orthogonal structure that consists of the union between two spatial dimensions and a temporal dimension. The spatial dimensions, structured 2D scale, represent the location of individuals, while the dimension of time represents the timing of the individual movement in a spatiotemporal system (Miller, 2004).

Several variables can represent the characteristics of the daily activity of an individual: location, time, duration, sequence and frequency of the type of activities (Ren & Kwan, 2009). It must be associated with at least one activity. Distinguished two types of activities: the movable and stationary activity. Mobile activity refers to a local motion toward another, while the stationary activity leads to a fixed location. Representation in Hägerstrand system is done in two ways: by vertical line segment when it comes to a stationary activity and a sloping straight line when there is movement toward a certain place (Chen et al., 2011).

In recent years, attempts have been incremented to store and manage the activities of an individual based on their spatial and temporal characteristics (Chen et al., 2013; Wang & Cheng, 2001). This type of analysis has been mainly used in studies that assess individual accessibility (e.g., Delafontaine et al., 2011; Kwan, 1998; Miller, 1999; Neutens, 2015; Neutens et al., 2007). These studies demonstrate that the considerations of space-time contribute to the presentation of more complex models and real human activities (Shaw & Yu, 2009).

Real-Time GIS model was assumed as a new paradigm of information science to capture the real characteristics of human undertakings (Hey, 2012) and transforming historical changed data to real-time data (Gong et al., 2015). The authors divided the model into three stages: temporal snapshots (1st stage), object-shift (2nd stage) and events and action (3rd stage) (Figure 2).

Real-Time GIS analyses have also sought to incorporate collaborative functions. These types

Figure 2. Three stages of real-time models

Source: (Adapted from Gong et al., 2015).

of tools can be differentiated into several types, namely:

- The same time - same place;
- Same time - different location;
- Different time - same place;
- Different time - different location (Sun & Li, 2015).

The Real-Time Collaborative Geographic Information System (RCGIS) enables analysis of interactions in agile and flexible systems, equipped with collaborative principles.

The unprecedented growth of geographically referenced information combined with recent digital augmentation reality (AR) of places growth will become increasingly important in the future (Graham et al., 2013). AR had its recognition in 1992, when Caudell and Mizzel developed works for Boeing and designed a digital transport display in the head, so as to enable a framework of airplane schemes (Yew et al., 2016). Yet, the concept of AR is much older. This was used during the period of World War II with a project developed with the presentation of information on the windshield of the camera. In this statement, there must be a relationship between reality and the information made available in digital media. To this end, there must be a technological device (smartphone or other wireless equipment), track-

ing and computer software. AR is summarized in three distinct properties:

1. Combination of real and virtual objects in the real world;
2. Run interactively in real time; and
3. Registration of real and virtual objects and their connection (Azuma, 1997).

AR is receiving several applications for PC, smartphones, tablet and other devices and will be increasing in the future.

These advances in various types of GIS technologies can create significant digital divides, disadvantaging the poor, ethnic and racial minorities, residents in rural areas, the inhabitants of the global South. The own readiness for open apps coding creates exclusions face to those who can only view and contribute to these features (Elwood, 2009).

FUTURE RESEARCH DIRECTIONS

Information technology and Geographic Science are growing abreast and rapidly. Developments of GIS technology and applications must grow behind the scope of Big Data, Cloud GIS, Real-time GIS and Augmented Reality challenges. For future research, a more rigorous approach should

be implemented and guided by technology interoperability, integrated multidisciplinary approach, security, how to benefit and integrate GIS database with citizen-collected data and deeply understand how to collect and analyse real time data. The advent of data needed will be exceeded by the abundance of real time data arising the challenges on how to detach different sources to canvass their quality and include them in spatial analysis. For this more deeply and integrated analysis models are required and at the same time more spread applications will be required to provide the spatial information by multiple technological devices.

CONCLUSION

The expansion and advances of GIS technologies created conditions to proliferate different approaches to work in multiple areas, such as geography, cartography, remote sensing, image processing, education or environmental sciences. This section presents the evolution of GIS from its conception to the present. Moreover, it shows the main challenges posed by multiple skills acquired by the GIS in recent decades, namely presenting a shift from traditionally confined public planning areas to multi collaborate users, from desktop to the web and from real to virtual and augmented reality. In fact, maps have always been used for the removal of political borders, but today the networking capabilities generated conditions for GIS intelligence statement. The development of the web has supported the new challenges associated with GIS, particularly in areas connected with augmented reality, the real-time GIS information, GIS space-time or Cloud GIS. Associated to this arise Big Data challenges and problems to the Geographic Science (GS). The cumulative advances in the relationship between GIS and Web can hence contribute to the expansion of information generated and treated, interoperability between servers and users and networking. Geographic information will reinforce their position in our day's life and for GS those trends will catch much more research than ever.

KEY TERMS AND DEFINITIONS

Augmented Reality: Augmented Reality (AR) into GIS assures the link between the perception of user and the relationship with the real world. The real world is represented with 2D and 3D virtual information. The computer augments the actual landscape with additional information that can be supported by inserting fields based on GIS applications.

Crowdsourcing: Crowdsourcing is an act of performing a GIS task by a user on a voluntary basis for a set of users. This type of action is based on a bottom-up approach. It is associated with the creation of data through a group dynamic. The crowdsourced data collection is carried out using portable devices (GPS, PC, mobile phones) and the data is synchronized in the central database, accessible and shareable, based on services and maps on the web.

GIS in the Cloud: GIS in the cloud or cloud GIS bases on the integrated web systems. The data generates maps to support the analysis and optimization of real time operations. The cloud integration helps the organization of complex workflows and maintaining extensive geodatabases.

GIS: GIS is a system that permits to visualize, analyze, display and understand the relationships between spatial phenomena. Nowadays, GIS is capable to transform large numbers of data, to

analyze and transform momentarily alternate data and generate charts, graphs, summary and descriptive statistics. Among the main key elements to a noble GIS it is noted: computer hardware and software, operational context (people and organizations) and internet service.

Real-Time: Real-time is a term often used to describe the time of execution of a task. This tool helps the users to obtain a frequently monitoring and more efficiently. GIS technology enables the sharing of a series of real-time data. Among the main features is visualization, analysis and understanding of phenomena in reduced timescale.

Pace-Time: Space-time is suggested in Hägerstrand time-geographic framework. Presents and analyses the individual activities in time and

space dimensions. In GIS environment results in the spatial representation of the dimension x and y and temporal dimensions of time in hours, minutes or seconds. The space-time patch is used for the implementation of the daily trajectory of the individual in time and space.

Web-Based GIS: Web-based GIS is based on a type of distributed information. This set of technological services is part of a communication structure between the GIS server and the client. Their relationship is expressed through URLs (created by the server) and HTTP (for the customer). Spatial data access, advanced mapping and spatial analysis are the most common type of analysis options in Web-based GIS.

Geospatial Influence in Science Mapping

INTRODUCTION

Sharing and making research data publicly available are increasingly getting attention to academia and research policy agenda. According to a 2014 European Commission guidelines for the re-use of datasets (OJEU C/240-1), geospatial data is of most importance. It raises an invaluable opportunity for libraries to play a dominant role in the not-so-distant-future for managing large collections of open (geospatial) research data. However, the geospatial dimension goes beyond data itself and embraces a wide range of spatial analysis and techniques (Smith et al., 2015). In particular, mapping and visualization techniques of geospatial data may provide endless opportunities to libraries and information science researchers in the sense of exploring the most of large open research datasets from a new perspective. With exceptions, librarians and information science professionals miss an overall perception of the possibilities that geospatial data and tools may bring them to geographically explore, analyze, and mapping research datasets and, especially, science related data. The question we pose in this chapter is whether or not geospatial technologies and mapping techniques have a role in the know-how of librarians and how these technologies and techniques may influence science mapping. Furthermore the chapter aims at drawing attention to the opportunities that the geospatial dimension applied to science related data can bring to the field of science mapping.

In what follows, the chapter briefly distinguishes the notion of mapping between the Geospatial

Information Science (GIScience) and Librarianship and Information Science (LIS). Afterwards, an overview about recent initiatives and research work relative to (geospatial) mapping of science is presented. Based on these examples, opportunities and challenges of applying geospatial technology to science mapping are discussed. Finally, based on relevant while evolving geospatial technologies, next steps for increasing up the influence of geospatial technology in science mapping are pointed out.

BACKGROUND

Concepts and Terminology

Science mapping, bibliographic mapping, or mapping scientific bibliography is often defined as a visual representation of how scientific disciplines and fields, authors and institutions, and scientific and technical documents and articles are related to each other (Cobo et al., 2011; Small, 1999). In order to define the aim and scope of the present chapter it is paramount to first clarify what actually science and mapping mean in the expression ‘science mapping’.

Firstly, the focus on ‘science’ in the term science mapping refers to all the data and metadata generated during the gathering and compilation of scientific bibliographic information such as: authors, article titles, source, citations, affiliation, and related scientific data (Chen, 2013). This data will be afterwards processed, analyzed and visualized using different scientometric techniques

(Garechana et al., 2012). It is worth noting that bibliography data is only one potential working area to which geospatial technology and GIScience can be applied. Other areas within LIS, such as geospatial segmentation of patrons for marketing purpose and indoor position inside library buildings for space management and for enhancing navigation of patrons, are also of interest to GIScience (Aguilar & Granell, 2013; Granell & Aguilar 2013; Scaramozzino et al., 2014; Aguilar & Granell, 2015).

The second, and most important, clarification refers to the term ‘mapping’, which may have different connotations from distinct fields and disciplines. As the chapter mixes ideas from two distinct fields or disciplines, namely LIS and GIScience, it is worth delimiting early the scope of ‘mapping’. As introduced earlier, science mapping or bibliometric maps of science, under the lens of the Librarianship discipline, is meant to visually represent bibliographic data relative to science. Noyons (2004) provides a clear definition of the resulting science maps in which “the items are positioned in relation to each other in such a way that the ones which are cognitively related to each other are positioned in each other’s vicinity, whilst the ones that are not or hardly related are distant from each other”. For example, we can have citation mappings, as visualizations of citation networks from scientific documents, or author mappings, as the analysis and visualization of collaboration (joint articles) among scientists. In general, as these mappings explore datasets relative to scientific activities and results, they are altogether referred to as science mapping.

In the current literature, though, the term “mapping” often refers to “record in detail the spatial distribution of (something)” (Oxford definition’s map - verb) (English Oxford Living Dictionaries, 2016), which refers to spatially arranging data over an area. For example, network diagrams using force-directed layout are common visualizations for science mapping (Boyack et al., 2015). Despite these visualizations of science maps evoke items displayed on a geographical map, such a

meaning of mapping has nothing to do with a geographic map or displaying data on a map. From the GIScience perspective, though, (geospatial) mapping implies to explicitly project data on a (geographical) map. For doing so, data must be georeferenced, in other words, data must contain a clear reference to a position or location, in order to be spatially displayed in a map. Furthermore, the main difference is that science mapping in LIS usually refers to visualizations that do not necessarily include or rely on a (geographic) map. Network graphs are typical examples of visually arranged bibliographic data because they emphasize the connectivity of data, i.e. network graphs provide an easy way to quickly grasp how items of data (e.g. authors, publications, citations, institutions, etc.) are connected. Furthermore, in this chapter, the term science mapping refers to ways of visually representing bibliographic data or science-related data, but paying special attention to technologies, concepts and analysis techniques from GIScience for creating such visualizations. Indeed, as we outline later on, the geospatial influence in the science mapping literature is still anecdotal.

Before going into the literature review, it is important to briefly introduce the concepts of geospatial analysis and visualization which are used extensively later on. Geospatial analysis is concerned with statistical and analytical techniques to process geospatial data, paying particular attention to topological, geometric, or geographic properties of the data. The typology of data (geospatial) calls for slightly different types of analytics than those found in the literature (Chen et al., 2012). In short, there exist two grand categories of spatial analysis techniques according to the dichotomy of geospatial data: vector-based or raster-based data. In the case of vector-based data, typical and basic operations are map overlay (combining two or more maps or map layers), and buffering (identifying regions of a map within a specified criteria (distance, time, etc.) of one or more geographic entities or features, such as buildings, streets, or town). Raster-based data, though, is more often used in disciplines such as environmental sciences

and remote sensing other than LIS. Nevertheless, analysis techniques for raster-based data still might be helpful for surface analysis. These raster-based techniques typically involve a range of actions (such as filtering and algebraic operations) applied to the grid cells (i.e. an image is often divided in regular individual units or cells that altogether form a grid) of a single raster layer (image) or multiple layers. These actions involve processing one or more raster layers according to some statistical rules leading to a new raster layer. For example a surface analysis computes each cell value by interpolating values from neighboring cells. Visualization thus complements geospatial analysis in that it centers on the use, creation and manipulation of images and maps to effectively transmit spatial information to end users (Slocum et al., 2008; Dodge et al., 2008).

Related Work

Science mapping is a sort of analytical process composed of well-defined tasks that include but are not limited to data access to sources, data preparation, computation of similarities measurement, analysis and visualization methods. Cobo et al. (2011) reviewed in detail each step of the science mapping process and provided pointers to further related work and literature for interested readers. Cobo et al. (2011) also compared various software tools that are aimed to perform mapping science analysis. The authors identified only three tools (out of nine tools) – Science of Science (Sc2) Tool, CiteSpace, and VantagePoint – that to some extent supported some basic types of geospatial analysis and visualizations. What is relevant to this chapter is whether (or not) geospatial analysis and visualization techniques are used in science mapping, which could make a big difference in yielding novel insights during the visualization and interpretation of such science maps.

Geospatial techniques commonly used are merely geocoding and geospatial thematic maps. While geocoding is the task of attaching a location and/or position to a piece of data to turn it

in spatial data, geospatial thematic maps result from visualizing one or more spatial datasets over a world or base map (e.g. Figure 1). Scimago Institution Ranking web site provides data visualizations of bibliometric indicators such as international collaboration and normalization impact of worldwide research in government and higher education institutions. Figures 1 and 2 show some Scimago available visualizations, ranging from simple geospatial mapping visualizations (e.g. choropleth maps, i.e. a sort of variation of thematic maps) to more traditional, spatial representation in tabular form like distribution charts and scatterplots.

Based on this Scimago data set, researchers have explored the distinct geospatial signatures among countries and institutions attending to indicators like international collaboration and leadership (Maganote et al., 2014). The authors used scatterplots to explain how geography matters in finding unique patterns derived from bibliometric indicators taking into account distinct geographic regions to show how international collaborations behave differently from regions to regions. Similarly, Pan et al. (2012) studied the geography of worldwide citation networks using a data set other than Scimago data. The article tries to validate the Tobler's first law of geography – “Everything is related to everything else, but near things are more related than distant things” (Tobler, 1970) – using citations networks and collaborations between scientists, without the authors explicitly mentioned it. Their hypothesis is that scientists tend to interact more frequently with other scientists who work in nearby areas forming clusters based on geographical proximity. In a similar vein, Chen (2006) described the CiteSpace toolset (<http://cluster.cis.drexel.edu/~cchen/citespace/>) for visualizing and analyzing trends and patterns in scientific data, especially to detect cluster and citations hotspots (Chen et al., 2010).

It is worth noting the recent work conducted by the Semantic Web journal (SWJ) by IOS Press to set up a modular, linked data-driven web portal for data relative to the journal activities, scientific

Figure 1. Choropleth map to categorize countries in function of the number of institutions from the Scimago Institution Ranking (Source: Scimago Institutions Rankings, n.d.).

Figure 2. Map display for international collaboration indicator (Source: <http://bit.ly/1RdW7IH>)

papers, authors, editors, and reviewers (Hu et al., 2013). Apart from the fact that the web portal is semantically-enabled, i.e. all data is linked and encoded using semantic data formats and exposed through an SPARQL endpoint, what is relevant in the context of the chapter is the inclusion of

spatio-temporal visualization to better understand how authors, co-authors, and authors citations are geographically related to each other in order to for example detect hot or densely connected regions in science (Bornmann & Waltman, 2011). Figure 3 shows some types of visualizations provided

by the SWJ Web Portal. Left part of Figure 3 appears a cartogram that takes a location and resizes (distorts) the geographic area according to a value of indicator and/or variable being analyzed. Each nation's size gives a qualitative indicator of the geographical distribution of contributing authors to the SWJ journal. Cartogram are widely recognized as geographically-influenced data visualizations in information science (Olmeda-Gómez, 2014).

In the particular case of scientific publications, bibliographic reference management tools are useful to help users collect, categorize, and annotate their references of interest, which is a usual service offered by libraries. Also, cloud-based reference management services that incorporate social aspects (sharing, ranking or scoring references) like Mendelev or ReadCube are gaining momentum over the past years. Even traditional desktop solutions like Endnote have recently launched its counterpart cloud-based tools. A remarkable research done to let users browse, navigate and query a collection of scientific datasets through spatial and time dimensions is TimeBibliography (Siabato et al, 2013; Siabato et al., 2014). It is a

dynamic web tool that hosts bibliography data relative to temporal GIS topics. As depicted in Figure 4, it provides novel ways to browse an online repository through dynamic and innovative visualizations that attempt to exploit temporal and spatial attributes for each bibliography metadata record, amongst others. For example diverse types of timeliness visualizations to explore long and short periods of time are integrated into the user interface (upper part of Figure 4).

Finally, Field and O'Brien (2010) introduced the spiral spatio-temporal timeline visualization of geo-located tweets, where size of symbols larger denote recent tweets, the same color identify common words, and the location of individual markers in spiral denotes spatial association with the real origin. This experimental Twitter Map visualizations that use connected graphs may be a starting point to enable more sophisticated and informative network-based visualizations. Again space and time turn out to be key contextual information to better understand the dynamics of a connected network of people (or citations, papers, tweets, etc.)

GEOSPATIAL INFLUENCE IN SCIENCE MAPPING

Despite the wide use of geographic terminology such as mapping or maps in bibliometric and scientometric, geospatial analysis and visualization methods have been largely unexplored in the literature. The brief overview described earlier presents interesting but incipient examples that attempt to include the geospatial dimension in mapping scientific bibliography data. It seems clear that there is a niche for applying geospatial aspects in science mapping, and it needs further exploration. The process of science mapping could take advantage of a wide range of geospatial analysis and visualization techniques so as to reveal new patterns and insights. Therefore, to suggest new areas where geospatial aspects can leverage science mapping to a new level, we rely on the concept of cybermetrics. Orduña-Malea and Aguilló (2015)

provided a holistic view of the academic field of cybermetrics. The authors identified three main working areas within cybermetrics:

- Descriptive cybermetrics,
- Instrumental cybermetrics, and
- Applied cybermetrics.

For the sake of clarity in the exposition, this classification is taken in order to come up with unexplored uses of geospatial related techniques in science mapping.

Descriptive cybermetrics refers mainly to the definition and modelling of cybermetrics indicators. It is well beyond the scope of the chapter to discuss existing indicators, their classification and scope in the concept of cybermetrics or science mapping. What is somehow surprising is that, despite recent studies highlight the importance and relevance of geography in science mapping

(Pan et al., 2012), geospatial characteristics has still poorly influence when defining bibliographic or cybermetrics indicators. Such geographically-aware indicators may give a completely new perspective of the underlying data being analyzed and visualized, and thus could serve for multiple purposes, ranging from professional career and project evaluation processes to policy making processes, as well as to even estimate the geospatial influence of an individual researcher, a scientific institution, or groups of researchers and institutions. In particular, the geospatial influence of an individual scientists has been recently explored by Zhan et al. (2014) for example. The authors devised the GeoSI index, which computes the number of countries or regions where researchers have cited a scholar's work during a given period of time, to get an estimation of the geographic coverage of the scientific influence of an individual scholar. Through the GeoSI index, the authors also examined how citations of a scholar have expanded to different countries over time, leading to the geographical influence or penetration of the research topics of one's work.

As instrumental cybermetrics is concerned with the methodological steps to obtain and process data to conveniently assess the feasibility of cybermetrics indicators, which is out of the scope of the chapter, the focus is shifted to the third and last area, applied cybermetrics, which in turn relies on both descriptive and instrumental cybermetrics.

Applied cybermetrics refers to the application of indicators (modelled by descriptive cybermetrics) combined with data analysis and visualization techniques, and altogether applied to concrete scenarios, use cases, and application domains. Scientific bibliography in general has been traditionally a recurrent domain where applied cybermetrics has been extensively used and explored. In the related literature concerning applied cybermetrics and academia, geographic network diagrams are used to represent patterns over a base map (Hu et al., 2013). Such geographic network diagrams combine network analysis methods (Boyack et al., 2005), com-

monly used for links analysis being for example co-authorship or citations those links, with geospatial visualizations by projecting these linked networks into a geographic map. This permits the detection of strong and weak geospatial connections among geographical areas, regions and nations. Unfortunately, geospatial visualizations in science mapping are practically constrained to geographic network diagrams, cartograms, and geospatial thematic maps. A similar deficit occurs in geospatial analysis, since geocoding is the most geospatial method used (for preprocessing data) in science mapping projects. There exist a great deal of untapped spatial analysis methods for the mapping science community (Smith et al., 2015), which for example combined with link analysis, network analysis, or data mining techniques, could most likely bring rich spatial contexts to science mapping in form of innovative geospatial data visualizations and explorations.

Apart from the lack of spatial techniques for data analysis and visualization, those few science maps that exploit spatial dimensions in bibliographic data do not consider interactive and dynamic feature in data visualizations. This prevents researchers, patrons, governors, and administrators from analyzing, understanding, and visualizing scientific maps and networks from a spatio-temporal perspective, which in the end pursues to improve the communication of information through maps.

FUTURE RESEARCH DIRECTIONS

Interactive, dynamic, and spatio-temporal visualizations are extremely useful in science mapping. Nevertheless preparing and processing geospatial data to fit the purpose of science mapping projects are time-consuming tasks. The value would not remain only in the set of references or bibliographic data, but in the availability of right tools, as spatio-temporal visualizations based on maps or other kind of charts, to enable visual analysis to inform users on the temporal, spatial, and topi-

cal variations of a given scientific topical area. In such a way, such tools could benefit researchers and scientists, as well as other collectives, as Noyons (2004) argued, such as funding agencies (to prepare research calls and evaluate research results, for example) and research policy makers (to establish topics priority and research plans in the long term).

The availability and efficiency of software tools depend strongly on the rapid changing pace of technology. Groenendyk (2013) provided an overview of emerging data geospatial visualization technologies which looked futuristic at first glance but which are partially being deployed in real projects. Holographic imaging and maps, 2-D city models, and 3-D printing were pointed by Groenendyk as key technologies for map libraries. Could existing 2-D network visualization for science mapping turn into immersive graph visualizations? Or even into physical 3-D models produced by 3D printers? Current technologies already open new opportunities for creative and innovative data visualizations for science mapping.

CONCLUSION

This chapter have presented some science mapping initiatives and research works that are being slightly influenced by geospatial technology. We argues that this trend have just started, as most of literature research works are exploratory research projects that merely grasp the surface of what geospatial technology might offer to science mapping analysis and visualization. As Field and O'Brien (2010) noted, "extracting and using the spatial and temporal dimensions reveal a contextual richness needed to truly represent and spatially organize meaningful information in a map". Location is key context, and such spatial context should be truly embedded in analytical and visualization processes for science mapping projects.

KEY TERMS AND DEFINITIONS

Applied Cybermetrics: Applied cybermetrics refers to the application of indicators (modelled by descriptive cybermetrics) combined with data analysis and visualization techniques, and altogether applied to concrete scenarios, use cases, and application domains. Further information is available in Orduña-Malea and Aguilló (2014).

Bibliometrics: “Bibliometrics is statistical analysis of written publications, such as books or articles.” Bibliometric methods are frequently used to provide quantitative analysis of academic literature or for evaluating budgetary spending. “Citation analysis is a commonly used bibliometric method” (source: Bibliometrics, 2016).

Cartograms: A cartogram is a map in which some thematic mapping variable – such as travel time, population, or socio-economic variables – is substituted for land area or distance. The geometry

or space of the map is distorted in order to convey the information of this alternate variable (source: Cartogram, 2016).

Choropleth Maps: A choropleth map is a thematic map in which areas are shaded or patterned in proportion to the measurement of the statistical variable being displayed on the map, such as population density or per-capita income. The choropleth map provides an easy way to visualize how a measurement varies across a geographic area or it shows the level of variability within a region (source: Choropleth Map, 2016).

Geospatial Mapping: Geospatial mapping is a type of spatial analysis techniques that typically employs software capable of rendering maps processing spatial data, and applying analytical methods to terrestrial or geographic datasets, including the use of geographic information systems.

GIScience: Geographic information science (GIScience) is the scientific discipline that studies data structures and computational techniques

to capture, represent, process, and analyze geographic information. Goodchild (2010) summarized its core interests, including spatial analysis, visualization, and the representation of uncertainty (source: Geographical Information Systems).

Scientometric: Scientometrics is the study of measuring and analyzing science, technology and innovation. Major research issues include the measurement of impact, reference sets of articles to investigate the impact of journals and institutes, understanding of scientific citations, mapping scientific fields and the production of indicators for use in policy and management contexts (source: Scientometrics).

Spatial Analysis: Spatial analysis or geospatial analysis includes approaches to applying statistical analysis and other analytic techniques to data which has a geographical or spatial aspect, most notably in the analysis of entities using their topological, geometric, or geographic properties (source: Spatial Analysis, 2016).

Parallel Development of Three Major Space Technology Systems and Human Side of Information Reference Services as an Essential Complementary Method

Joyce Gosata Maphanyane

University of Botswana, Botswana

INTRODUCTION

Ever since the first human footprints were made more than 1,9 million years ago; the Homo erectus Era; ‘upright man’; socio-economic-Historical Development came into being. When humans could walk; it left their other limbs, the hands free to do other things. This Era was followed by the Stone Age; the man used stone tools to defend their territories and to hunt for food. This culminated to the Bronze Age and the Iron Age. These were the human development eras when man could actually work with minerals to make tools. These people could farm and rear domestic animals. The primitive smelting industries grew into the Industrial Revolution; The Industrial Revolution was a period from the 18th to the 19th century. The major changes in agriculture, manufacturing, mining, transport, technologies had a profound effect on the socio-economic and cultural conditions. This was followed by the Information Age; the Era we are in now. It is a shift from traditional industry that the previous era brought through industrialization. It is an economy based on the manipulation of information. The Information Age has allowed rapid global communications and networking to shape modern society. It is a digital world of Information Communication Technology (ICT). It is also commonly known as the Computer Age or Information Era, and it is an idea that the current age will be characterized by the ability of individuals to transfer information freely, and to have instant access to knowledge that would have

been difficult or impossible to find previously. The idea is linked to the concept of a Digital Age or Digital Revolution. This chapter elaborates upon Geographical Information Systems (GIS) and Remote Sensing; the highest echelon of the ICT world. It looks at their development in studying our home, the Earth and its systems. In particular it looks at, compares and contrasts the four globally used systems; these are:

- **GOES:** The Geosynchronous Orbiting Environmental Satellite;
- **LANDSAT,**
- **SPOT:** Satellite Pour l’Observation de la Terre and
- The WorldView.

The first three has transacted five generation and the last system, the WorldView is the newest and most fast developing satellite system. These Earth Resources Data capture satellite systems are compared in their longevity - temporal resolution and age factor which gives results as:

- **LANDSAT1 (ARTS 1) - LANDSAT 8** range July 1972 to February 1993;
- **GOES 1 - GOES 15,** Range October 1975 to March 2010;
- **SPOT1 – SPOT 7** range February 1986 to June 2014 and
- **WorldView 1 – WorldView 3,** range September 2007 to August 2014.

DOI: 10.4018/978-1-5225-2255-3.ch303

The comparison criteria were made based on spectral resolution (Figure 5 – WorldView 3); spatial resolution (Figure 6 – WorldView 3) and radiometric resolution (Figure 7 – SPOT). Apart from that; the human side of information reference services in the form of Traditional Ecological Knowledge (TEK) is discussed as it is an essential complementary entity in GIS and remote sensing endeavours. In order to be useful information, the remote sensing data need human input in the form of referencing coordinates system, data interpretation using the visual variables of position, shape, size, texture, tone, orientation, and motion. These can then be analyzed and used for modeling the environment, disaster preparedness and decision making. The 3 Dimensional characteristics of satellite, digital elevation models (DEM) (Figure 7 – SPOT DEM) are also investigated.

The Chapter is also about the essence of data sources specific for geo-spatial science (Bossler, Jensen, McMaster, & Rizos, 2002) information for land cover mapping. The use of geospatial science techniques provides opportunities and challenges in many aspects of life including for land cover, forestry for climatic change measurements and agricultural engineering which is vital for food security (Opara, 2003)

First, it elaborated about developments of digital world in remote sensing and geographical information system (GIS) as modern day techniques for Earth surface monitoring (Mather & Koch, 2011). Satellites whose data has widespread international applications for the past four decades are discussed in details and compared. Second, it puts emphasis on the importance of the human side of information reference services that is essentially the brain behind machine based data. The human thinking is applied in the interpretation of this machine data and it acts as knowledge substitute where the remote sensing and GIS data are inadequate or unavailable. The 2012 study (Maphanyane, 2012) on the reconstruction of historical landscape for the investigation of land cover changes in the human side of information reference services based method on Ramotswa,

Botswana case, had sufficiently proved that it can be applied to fill in the gap where modern technology is inadequate or unavailable (Figure 1 and Table 1). For emphasis, graphical examples are given, where the aerospace based Ramotswa digital data; its analytical techniques and their resultant information are compared to the same area data, but those that had been derived from the systems based on the human side of information reference services (Figure 2). This too has shown that the human side of information reference services was complementary.

BACKGROUND

The essence of this study hinges on technological developments of robust data collection tools. Remote sensing is one such. It shows the importance of human side of information reference services and the role it plays still, as it adds meaning and time independent data sources, even in the wake of superior tools of remote sensing.

Curiosity of Humankind: Their Cognitive Ability and Feature Naming

Humankind interest in the distribution of everything that exists on and beyond the Earth itself was triggered by what they could see (Benedict, 2002). The evidence to their cognate abilities is the byzantine names they gave to the phenomena. The Batswana were captivated by all that was around them. Some evidence in that are meaningful names they gave to celestial bodies (Kitauro & Enßlin, 2008) They also employed the skies - *legodimo* as direction tools and identification of time and its subdivisions using daily and seasonal rhythms. They put what seemed to be a scattered litter of sky furniture into distinguishable bodies with meaning. The obvious ones been the *Sun - Letsatsi*, it was used to distinguish between night and day – *Bosigo* le *Motshegare* and the stars – *Dinaledi*. *Mars* was also identified and named *Mphatalatsane*, the red

Morning Star and the *Pointer*, the All-Night-Long Star – *Kgogamasigo* was observed as well. *Venus* – *Kopadilalelo*, the evening star - has long being observed by this people as the second brightest body after the Moon - *Kgwedi* - in the evening skies, but different from the stars as it was always in the same planetary position. The moon is the celestial body most used by the Batswana. The Motswana female-body functions, the menstruation cycle, conception, child-birth and well-being are believed to be dependent on the cadence of the moon. Also, theories about the eclipse of the Sun and the Moon, and the Comets were also devised. For example, the visit of a Comet was a bad omen,

and it might signify something bad, or it might only foreshadow the death of some great chief.

Also, the humankind cognitive abilities are revealed by the work of the Egyptians who had created the precise terrestrial map of the three stars of Orion's belt in the ancient times as early as 10,500 BC; the era of Leo as depicted by the Sphinx of Giza. In this symbolic map, the Milky way is replicated onto the ground by the position of the River Nile and the positions of the three pyramids of Giza have been plotted against the three belt stars of the Orion constellation as such the great pyramid of Khufu occupying the position of Al Nitak; the second pyramid of Khafre tak-

Figure 1. Botswana: South East District

ing the place of Al Nilam and the third pyramid, Menkaure, representing the smallest star which is at an offset position (Hancock, 1995). Modern horoscope astrology is associated with the interaction of Indian and Hellenistic cultures in the Indo-Greek period (Pingree, 1981; Dhavale, 1984) and their eras had been named as stars thus:

- Aquarius,
- Pisces,
- Aries,
- Taurus,
- Gemini,
- Cancer,
- Leo,
- Virgo,
- Libra,
- Scorpio,
- Sagittarius, and
- Capricorn.

Remote Sensing Essentials

These human visual (Sensor) abilities as mentioned above have been amplified by scientific technological developments of remote sensing. Remote sensing is the science and art of obtaining information about an object, area or phenomenon through the analysis of data acquired by a device that is not in contact with the object, area, or phe-

nomenon under investigation (Lillesand & Kiefer, 2004; Jensen, 2005; Schowengerdt, 2007; Mather & Koch, 2011; NASA, 2013). This is done by sensing and recording reflected or emitted energy and processing, analyzing, that into information which is then applied for informed decision making. This is possible because different substances like the Earth's surface phenomena absorbs, transmits and reflects electromagnetic waves energy from the source e.g. the Sun in ways that are diagnostic to the type and condition of the reflecting material. Then this reflected energy could be captured by various satellite sensors. Then, information could be extraction from the resultant images for use. One other thing that is crucial to the fundamentals of remote sensing are the distance (altitude) between the observer and the phenomena been captured and the type of the sensor.

Phenomena under study could be observed from sensors on board platforms anchored at different altitudes, determining the instantaneous field of view and the scale of the data, the spatial resolution. This means that a phenomenon can be viewed from high altitudes in its entirety at a small scale and/or only a part of it can be viewed in detail from lower altitudes at a large scale. It is always beneficial to have a closer view of phenomena; but also seeing them at small scale can be beneficial too. Also, remote sensing allows for revisits of the same place at regular intervals, this count for the temporal resolutions and makes the study of trends possible. Furthermore different types of sensors with various characteristics are possible. That is the sensor used determines the electromagnetic waves window to be captured, its spectral resolutions. And furthermore still, the level of clarity in which the phenomenon is distinguishable from its surrounding, the radiometric resolutions could be measured. That is remote sensing sees what the human eye could perceive through the visible electromagnetic waves; and far beyond that, what the eye could not see; in the gamma ray, x-ray, ultraviolet light, infrared light, microwaves and radio waves. Remote sensing gives an option of studying the scientific nature

Table 1. Botswana: south east district data, comparison of the two methods for the investigation of land cover change.

Analysis of the Results on How Reconstruction of Historical Landscape Compares to Remote Sensing Method (Maphanyane 2012a)				
No.	Test Area	1973	1990	2002
1	Gaborone/Tlokweng	66.94%	66.13%	77.42%
2	Ramotswa	80.00%	71.79%	71.88%
3	Otse	65.27%	65.87%	67.07%
4	Mogobane	77.88%	70.72%	67.31%

Source: (Maphanyane, 2012a)

of phenomena. Even those phenomena that are hidden from normal human view like heat (thermal) and embedded moisture content in plants' leaves could be studied from this type of data as various wavelengths beyond the visible and these could later be viewed through false colour image creation by sophisticated computer software program. In the past fifty years great advances in remote sensing had been achieved by placing the sky-telescopic view, in space above the Earth's atmosphere; the Astronomical Remote Sensing (Kitauro & Enßlin, 2008). At these very high altitudes the focus is on capture gamma, x-ray, ultra-violet, visible, infra-red, microwaves and radio-waves spectrum emitted by the stars, galaxies, interstellar or intergalactic gases, and the void called "space" for their study. Space flight and exploration have led to new technologies that extend the capabilities of astronomers. For instance it is now possible to recreate and study the beginning of the Universe; the BIG BANG! And that the universe is expanding and is finite in both time and space (Jones & Lambourne, 2004). The study of detailed minute fabric of the matter – microscopic view, the Atomic Remote Sensing, which operates at particle or microscopic level, had always being possible in the field of chemistry (specific example (Linga, Kumar, & Englezos, 2007)), physics, biology, and geology and health sciences. Such devices include the microscopes, probes, electro and magnetic survey instruments, spectroscopes, scanners and x-rays. For instance, the absorption spectroscopy that uses infra-red and ultra violet and the UV light sterilisers are examples such devices (Nichol, Shaker, & Nichol, 2006). This article concentrates on the study of the Earth surface and its systems, that incorporates electromagnetic waves capture at altitudes of the ground, atmospheric and space view levels, the Earth Resources Remote Sensing. These what makes it possible for the environment to be studied in quick, frequent and more accurate ways. But, still remote sensing is not the panacea to everything; there are some problems. These normally call for human information reference services input. The four major problems related to

the Earth surface and its systems remote sensing, more specifically the space view data capture and analysis issues are that:

- Although, the remote sensing data capture goes beyond the human visual capabilities, it is machine based, it lacks human mind of reason, hence it needs:
 - To be calibrated and interpreted against the real-world phenomena for it to be meaningful and useful.
 - Trained people to interpret and analyze it.
- Besides all that, it is limited by its time of first data capture. Although it began in 1939, in the form of photogrammetry, the world view dedicated coverage by satellite imagery has only been available since 1972. Consequently, for research that spans periods earlier than this period, remote sensing data is non-existent. Then, since land cover change is a slow process, it is necessary to access evidence about the land cover conditions of past eras, world coverage data from 40, 50, 60, 100 years ago and beyond!
- Furthermore, its data is not automatically available everywhere. Besides, adverse weather conditions renders satellite images useless for the remote sensing analysis of land cover.

So, although remote sensing is useful; it still requires the human side of information reference services for it to be useable and also to fill up the gap were it is inadequate or unavailable. The method for the investigation of land cover change and trends by the reconstruction of historical landscapes could be used to alleviate the problems (Maphanyane, 2012).

Human Based Reference Services in Brief

The reconstruction of historical landscapes could be used as an alternative for the investigation of

land cover change. First, this method uses the elements of traditional ecological knowledge (TEK) of oral history, songs, poems, praise singing and relics. Second, it employs written records in the form of explorers' diaries (Livingstone, 1857; Rey, 1988), the government reports and development plans, the land laws and acts, verdict on major court cases on land disputes and land commissions concerning land uses. Third, it also utilizes the archival records which consist of land surveyors' field sketches, maps, photographs and aerial photographs (Shoemaker & Shoemaker, 1987). And fourth, yet again it uses the scientific endeavours like, archaeological research findings, fossil, sediments, dating such as ^{14}C carbon, ^{210}Pb lead, regional industrial pollutants and regionally significant biostratigraphic markers and the beta - globins, in particular, Mitochondrial deoxyribonucleic acid as research tools (Stringer, 2001).

These elements of reconstruction of historical landscape taken ensemble, enables studies that reach ages that goes far beyond dating epochs known today. Since this approach does not rely on technology in its original data capture phase, it can be applied anywhere and long time after land cover changes has taken place (Maphanyane, 2012).

The concept, the reconstruction of historical landscapes, in the context of this communiqué is defined as a method of building and mapping past landscapes by finding out how communities lived in a given historic period in a particular geographical area. This is achieved by identifying, reading and analyzing marks made at the time and left behind from certain period. This brings in a human element in the study. People's life and experiences, the knowledge that an individual has about his/her sphere of influence. It is acquired and registered in their mind through their experience of the area and it is continuously updated when new developments come up (Maphanyane, 2012). Maphanyane (2012) has further reported that each of these eight elements could be useful to the investigation of land cover change to a varying degree: That archaeological findings

and pre-historic sites for instance, gave useful background knowledge of the areas studied, and at such promoted a better understanding of the areas, and later helped in the analysis of the data (Ortner, Butler, Cafarella, & Milligan, 2001). That, Written records which included informal data like travellers diaries; are unique as the authors wrote these, true to themselves as they never knew that one day their work would be used for such a purpose. And other information came from formal data like government development plans. Such documents formed sources of continuous information, which are essential for a land cover change investigation. That the elements comprising of songs, lyrics and poems (Lightfoot, 1995) were difficult to get, hence sporadically available; but, once stumbled upon could prove to be useful where upon an entire history of a group of people could be embedded in one poem or the geography of the area could be sung in a lyric which would be remembered long after the particular landscape of an area had long been eroded. The elements of place names are essential, as they gave insights into past landscapes and the history of the earlier inhabitants of an area (Atteh, 1989; Mabona, 2004). And that the element of traditional ecological knowledge sourced from oral history (with examples coming from various literature - (Brokesha, Warren, & Werner, 1980; Davis, Back, & MacLean, 1992; Leffler & Brent, 1992; Delgamuukw v. British Columbia, 3 S.C.R. 1010, 1997; Russell, 1998); the cultural norms (Berkes, Colding, & Folke, 2000; Davidson-Hunt & Berkes, 2003; Donovan & Puri, 2004); questionnaires, interviews and field (Livingstone, 1857; Rey, 1988) gave the most complete evidence data for the land cover change investigation.

The human based reference services data sources approach deepened on the understanding of current environmental issues, including global warming, desertification, loss of biodiversity, sustainable resource use and sustainability of the biosphere (Russell, 1998).

Figure 2. Graphical comparison of Ramotswa, Botswana land cover change detection by reconstruction of historical landscape (ROHL – A, C) to that by remote sensing method (RS – B, D) for two periods - 1973 to 1990 and 1990 to 2002 based on ArcGIS Software Geo-spatial Statistics Analyst Module (Maphanyane, 2012)

MAIN FOCUS

The focus is on two distinction methods for land cover change investigations. First, the importance and developments of remote sensing as the geo-spatial data source are discussed. To

this end, analysis and comparison (Figure 3) of three satellites systems whose data had reached the most widespread global usage and that had stood the test of time that spans four decades are made. These are the Geo-synchronized Operational Environmental Satellite (GOES), for

international environmental disaster monitoring and weather focusing; the Landsat Systems, which is applied for land cover mapping in green house gas (GHG) carbon loads monitoring projects for the world climate change monitoring and mitigation endeavours; and the SPOT (the Satellite Pour l'Observation de la Terre), that provided the yearly images for the entire planet in Google Earth, "One World, One Year" project applications. The four trans-generational levels developments in spatial, temporal, spectral and radiometric resolutions of these systems have been explored. Second, yet again, comparison is made between these technical sources and the human service sources (Figure 2). That is another focus that brought in the highlights from the human side of information reference services as an essential complementary method that added meaning to remote sensing and that functioned as an alternative to fill-in the gap when these digital data are inadquent or unavailable.

The Advancement in GOES System

The basic element of GOES satellite is that they are geosynchronous and geostationary. They have the ability of remaining permanently in the same area of the sky, as viewed from a particular location on Earth, and so remaining permanently within view of a given ground station. Also, they have special ability that their paths follow a circular geosynchronous orbit directly above the Earth's equator. GOES came into operation in May 1974 then the first satellite SMS 1 was launched. Its program capture data in two levels; from instruments carried by platforms orbiting the Earth at altitudes of about 35 790 km and also from ground stationed data acquisition elements such as river and rain gauges, seismometers, tide gauges, buoys, ships and automatic weather stations.

Its constellation forms part of the global network of meteorological satellites (Leese, Noar, & Pastre, 1989), spaced at approximately 70° longitude intervals around the Earth in order to provide near-global data coverage on weather forecasting, severe storm tracking, and meteorological

research. The launches of these satellites are staggered to keep at least two operational satellites on orbit at all times. To date seventeen spacecraft has been put into orbit, the latest of these being GOES 15, launched in March 2010 and operates as GOES West located at 135°W over the Pacific Ocean. Other two satellites still in operational, are GOES 12 providing Latitude coverage for South America and GOES 13 operates as GOES east, and is currently located at 75°W. It provides most of the U.S. weather information. GOES R, S, T and U are scheduled for launch in 2016, 2017, 2019 and 2024 respectively. The proposed instrument package for the GOES R-series initially included: the Advanced Baseline Imager (ABI); the Hyperspectral Environmental Suite (HES); the Space Environment In-Situ Suite (SEISS), which includes two Magnetospheric Particle Sensors (MPS-HI and MPS-LO), an Energetic Heavy Ion Sensor (EHIS), and a Solar and Galactic Proton Sensor (SGPS); the Solar Imaging Suite (SIS), which includes the Solar Ultraviolet Imager (SUVI), the Solar X-Ray Sensor (XRS), and the Extreme Ultraviolet Sensor (EUVS); the Geostationary Lightning Mapper (GLM); and the Magnetometer (Hill, 2008).

GOES satellites are given an alphabetical number before launch and only designated a numerical number after launch. One launch failed, GOES G, and GOES 14 is in on-orbit storage, whereas GOES 3 and GOES 7 had been re-purposed to communications satellites duties, the former as a relay for Amundsen-Scott South Pole research station and the later by Peacesat. And among the seventeen, ten satellites have been decommissioned and boosted to graveyard orbit.

GOES is SMS 1 and 2 and GOES 1, 2 and 3 first generation make-ups, were sustained from 1974 to 1986 are characterized by latest models are the imager, a multichannel instrument that senses infrared radiant energy and visible reflected solar energy from the Earth's surface and atmosphere and the sounder that provides data for vertical atmospheric temperature and moisture profiles, surface and cloud top temperature, and ozone

distribution (Gunter, 1996). They carried the visible infrared spin-scan radiometer (VISSR), the solar x-ray imager (SXI), and space environment monitoring (SEM) instruments as well. Additionally, GOES carried meteorological data collection and transmission system that relayed processed data from central weather facilities to automatic picture transmission (APT) equipped regional stations and collected and retransmitted data from remotely located ground data acquisition stations (LaViolette & Diachok, 1974; Gunter, 1996). Five satellites, GOES 4, 5, 6, G and 7 with VISSR formed the second generation series that run from 1980 to 1995. They incorporated visible and infrared atmospheric sounder (VAS) another improvement from the earlier series that obtained atmospheric circulation patterns from frame-to-frame movement onto selected clouds at different altitudes and that captured the wind direction and its speed. The VAS added a vital third dimension to the imager; it improved the accuracy for weather prediction data (Gunter, 1996). From this system, GOES 7 had a signal transponding ability and it could locate ships and planes in distress (Doody & Stephan, 1993). The third generation includes GOES 8, 9, 10, 11 and 12 run from 1994 and is still in operational as GOES 12; the last of these series launched in 2001 is still in service; the rest have been decommissioned. These spacecraft payloads are new-generation Imager and a Sounder. The improvements on the SEM include the magnetometer, energetic-particle sensor, high-energy proton and alpha-particle detector, and a solar X-ray sensor and are used for in-situ surveying of the near-earth space environment. They provided 24-hour monitoring and measurement of dynamic weather events in real-time, and are the first to deliver simultaneous independent imaging and sounding from geostationary orbit (Gunter, 1996; SSL, 2013). The new body-stabilized spacecraft design enabled the primary sensors to “stare” at Earth and thus frequently image clouds, monitor Earth’s surface. Atmospheric phenomena were tracked, ensuring real-time coverage of short-lived dynamic events, such as severe local storms

and tropical hurricanes and cyclones. Temporal resolution of 15 minutes and the flexibility; for alteration of normal schedules that provided necessary coverage during significant weather or other events were made. The sensors have an imager with five channels/bands, so specific weather trouble spots were monitored to assist in improved short-term forecasting. The primary sensor is the *Advanced Very High Resolution Radiometer* (AVHRR). The fourth generation included GOES 13, 14, 15 launched between 2006 and 2010. This series, like GOES 12, have a *sun-pointed Extreme Ultraviolet Sensor* (EUVS). In addition to that their spacecrafts payload include the *Advanced Baseline Imager* (ABI); the *Space Environment In-Situ Suite* (SEISS), which includes two *Magnetospheric Particle Sensors* (MPS-HI and MPS-LO), an *Energetic Heavy Ion Sensor* (EHIS), and a *Solar and Galactic Proton Sensor* (SGPS); the *Solar Imaging Suite* (SIS), which includes the *Solar Ultraviolet Imager* (SUVI), the *Solar X-Ray Sensor* (XRS), and the *Geostationary Lightning Mapper* (GLM); and the *Magnetometer* (Segundo, 2010) (Figure 4).

AVHRR has lower spatial resolution (ranging from 0.9 km to 4 km) than other typical land observations sensors for example the Landsat and SPOT program, but its data is useful for study of phenomena which cover the entire globe. Advantages: Frequent coverage- very high temporal resolution, wide coverage covers whole hemisphere at one time, and that it is multi-spectral. So it is used extensively for monitoring regional, small-scale phenomena, including mapping of sea surface temperature, and natural vegetation and crop conditions (NASA - NOAA, 1992; Segundo, 2010).

Land Resources Satellites

The weather satellites are not optimized for sensing detailed mapping of the land surface. The data they bring back is just too coarse.

In 1965, director of the U.S. Geological Survey (USGS), William Pecora, proposed the idea

Figure 3. Landsat (LN) and SPOT satellites 1-4 generations panchromatic (GP) and multispectral (GM) resolutions

of a remote sensing satellite program to gather facts about the natural resources of the Earth. This was opposed by the Bureau of Budget for obvious reasons and the Department of Defense who feared that a civilian program would compromise the secrecy of their reconnaissance missions. Also, there were geo-political concerns about photographing foreign countries without permission. Eventually, after these huddles had been overcome, the initial idea culminated to the launching of Earth resources technology satellite (ERTS), which was designed to specifically to monitor the Earth's surface. In 1986, SPOT 1, a French, Landsat-like satellite was launched and it broke the United States of America spacecrafts land resource censorship monopoly.

Landsat Satellite System

ERTS-1, later renamed Landsat 1 was launched by NASA in July 1972. So far eight satellites have been launched in this system, five have been decommissioned, one, Landsat 6 was lost and two are still in service Landsat 7 and 8. The program is jointly managed by the United States Geological Survey (USGS) and NASA. The Landsat archival and latest data have been used in studies for monitoring the dynamic changes caused by both natural and manmade processes for informed decision making and resource management.

The first generation in this series is Landsat 1, 2 and 3 which were in orbit from July 1972 when Landsat 1 was launched to March 1983 when Landsat 3 was terminated. The spacecraft carried the camera system, with the Return Beam Vidicon (RBV), and the Multispectral Scanner (MSS). They orbited in near-polar, sun-synchronous at 900 km altitude (NASA - NOAA, 1992), and 18 days revisits, a much coarser temporal resolution than its predecessor, GOES. It had four multispectral bands; two bands in visible, green and red; and the other two in near infrared. The spatial resolutions were 60mx80m for Landsat 1 and 2; and 38mx38m for Landsat 3. The System's second generation; Landsat 4 and 5 started in July 1982, when Landsat

4 was launched and ended in December 2012 when Landsat 5 was terminated (the longest-operating Earth observation satellite). They have near-polar, sun-synchronous orbits hinged at 705 km altitude with 16 days revisits (NASA - NOAA, 1992). They carried two sensors, the MSS and the Thematic Mapper (TM). The TM sensor captured data in seven spectral bands in visible: blue, green, red' and the infrared: near-infrared, mid-infrared and thermal infrared. Bands 1-5 and 7 had a spatial resolution of 30mx30m; whereas, Band 6, was 120mx120m. Landsat 6 and 7 formed the third generation and it run from April 1999 when Landsat 7 was launched as Landsat 6 had been lost; to date. It had a relapse from the faulty scan line corrector for six weeks in May 2003. Then, the scientific community reverted back to using Landsat 5 imagery. Landsat 7 Like its predecessor was launched in near-polar, sun-synchronous orbits at 705 km altitude with 16 days revisits as well. It has the Enhanced Thematic Mapper Plus (ETM+) that replicated the TM characteristics; with an additional 15m spatial resolution panchromatic band and two thermal: Bands 6-1 and 6-2 with improved spatial resolutions of 60mx60m. Other major development is the on-board, full aperture, 5% absolute radiometric calibration, which rendered it the most accurately calibrated Earth-observing satellite and the on-board data recorder (SSL, 2013). The future of Landsat Satellites Systems lays on the fourth generation series, Landsat 8 launched in February 2013 with orbits and revisits similar to its predecessor (NASA, 2013), (USGS, 2013). It is the Landsat Data Continuity Mission (LDCM) generation pledged to ensure the continued acquisition and availability of Landsat-like data beyond the duration of the current Landsat missions. Landsat 8 major developments are the Operational Land Imager (OLI) with nine spectral bands, one panchromatic at with 15m resolution, four visible bands in green, blue, yellow and red; four infrared bands in one in near infrared, two short wave infrared and another one cirrus infrared; all these have 30m resolution. The OLI has improved signal-to-noise ratio compared

to past Landsat instruments. It also has a special Thermal Infrared Sensor (TIRS) with two bands at 100m resolution that measures land surface temperatures.

Initially, the costs of the images of this satellite series were prohibitive as they kept on rising from US\$ 600, to US\$ 3700 reaching a whopping price of US\$ 4400 per scene. As a result of this cost recovery mandate its use dwindled. The Landsat coverage standards also languished as many observations were missed because there was no buyer. As a result of this setback, the true scientific mission based on collects as much global data as possible for future scientific study motto failed, and as data was lost forever (Landsat5, n.d.). Eventually, in January 2009 all Landsat data were made free and its use immediately increased 60-fold (Satellite Imaging Cooperation, 2001).

SPOT Satellite System

SPOT System was initiated by the French Space Agency, Centre National d'Études Spatiales

(CNES), the Internationale Géographe Nationale (IGN), and Space Manufacturers; this was in collaboration with the Belgian scientific, technical and cultural services (SSTC) and the Swedish National Space Board (SNSB). SPOT is composed of both spacecrafts and a network of direct receiving stations handling images acquired by the satellites. It has been designed to improve the knowledge and management of the Earth by exploring the Earth's resources, detecting and forecasting phenomena involving climatology and oceanography, and monitoring human activities and natural phenomena (Satellite Imaging Cooperation, 2001).

SPOT's onboard sensors can point across the satellite track, providing a revisit capability of one to four days depending on latitude. The satellites are anchored at 832 km latitude and fly over any point on Earth within 26 days. The satellites capture both panchromatic and multispectral digital imagery from visible and infrared electromagnetic wave portion of the spectrum with a spatial resolution of 10m and 20 m respectively.

Figure 5. WorldView 3; Very High Spectral Image - Madrid, Spain (Source: Satellite Imaging Cooperation, 2001).

Figure 6. WorldView 3; Very High Spatial Resolution Image – Cape Town, South Africa (Source: Satellite Imaging Cooperation, 2001).

SPOT system has stereo pair imagery which is vital for applications that call for 3D terrain modeling Astrium. (2013). The first generation of SPOT satellite is SPOT 1, 2 and 3 that started in February 1986 up to November 1997. They had 4 spectral bands in one panchromatic, two visible: green and red and in infra red: near infra red. The second generation is composed of SPOT 4 launched in March 1998 to July 2013. It has five spectral bands, one in panchromatic, three in visible: blue, green and red and one infra red. SPOT 5 is the third generation satellite, launched in May 2002 and had five spectral bands It gave higher resolution of 2.5 to 5 m in panchromatic mode, 10 m in multispectral mode: green and red and 20 m on infrared: near infra red and short wave And the fourth generation of these, SPOT 6 was launched in September 2012 and SPOT 7 which was 30 June 2014. This 2 satellite form a constellation at 90° and at 694 km altitude and has five spectral bands. It has very high resolutions of 1.5 meters in panchromatic mode, 6 m in multispectral: blue, green and red mode and 20 m on short wave infrared: near infra red. This constellation offers a wide imaging swath, which up to 60 km x 120 km and like all SPOT satellites 3D capabilities (Figure 7). It is essentially used for the creation of 3-Dimensional data models – Digital terrain/Elevation Models – (DEM/DTM). The only three SPOT satellites which are still in orbit are SPOT 5, 6 and 7.

Satellites with Special Unique Applications

Other types of satellite systems worth mentioning here are those with unique capabilities which are indeed complementary to aerial spatial data capture efforts, although, in essence, their longevity and widespread use falls far short from the three explained above. The Indian Remote Sensing Satellite (IRS) satellite series the features mimic both the Landsat sensors and those of SPOT sensors; and has two-channel Wide Field Sensor (WiFS) as well with a coarse resolution that is equivalent

Figure 7. SPOT – DEM of Los Pelambres Mine, Chile (Source – Airbus Defense Space, 2013)

to GOES. The new Very High Resolution Remote Sensing Satellites (VHRRS) formats combine the spatial resolution equivalent to aerial photographs with the temporal, spectral and radiometric resolutions, which by far surpasses those possible with those three studied here. Examples are:

- WorldView (3.1m, 29 bands) (Figure 5 – Very High Spectral & Figure 6 - Spatial Resolution),
- GeoEye (0.41m, 4 Bands),
- QuickBird (0.61m, 4 bands),
- IKONOS (0.82m, 5 bands), and
- ASTER (15m, 14 bands).

The Radio Detection and Ranging (RADAR) satellites, known as the all weather, are unique, as they use the microwave energy which relatively has long wavelengths that allows these systems to “see” through clouds, smoke, and some vegetation. They generate their own energy, Active Sensors; so they can be operated day or night. All other satellite sensors, discussed above utilize the energy from the Sun; and are Passive Sensors.

Data from the Two Sources Interchangeability Problems

The main fundamental reasons for the differences between technical and human services sources are in the fabric of the origins of the data, when it happened, when and how it was preserved before it was eventually collected and used for the investigation of land cover change. The resolution of the data is paramount to its usefulness in both methods. It depends on the spatial, the thematic, temporal and the model resolutions. The spatial resolution is the smallest discernible unit in the geographical space whereas the thematic resolution addresses the level of classification aggregation used to show distributions of patterns in an area; the temporal resolution is how often data updates are made; and the model resolution gives the level of details incorporated in assessing any form of phenomena in an area.

- The basic tenet is that remote sensing and GIS and the method for the reconstruction of historical knowledge measured totally different things. For these two methods to be used interchangeably for the investigation of land cover change for a particular geographical area there is a need to reconcile what each of them measures.
- The challenge is to make them measure the same thing. So, to that end; a land cover class specification commensurate to the two methods was needed to be created.
- Besides all that, care must be taken when remote sensing cross generational data is used in the land cover change and trends investigations. This is because the remote sensing platforms and sensors have improved tremendously over the years. Consequently, land cover data from consecutive time period captured by satellite from different generation could show differences pertaining to the differences in visual abilities, due to the improved tools with better clarity that might be mistakenly taken to be the change the landscape.

- So, for that reason, for efficient land cover change investigation employment of trans-generation satellite data has to be taken with caution and some form of standardization and a form of calibration of data from the different generation satellite sources is necessary. The class separability was made within the particular Landsat sensor and across different sensors.

For instance classes which had very little separability in MSS sensor were found to have huge separability in TM and ETM+. It was difficult to attribute these differences to land cover change alone as there is technology development for the better in satellite sensor sensitivity at play as well.

SOLUTIONS AND RECOMMENDATIONS

The land cover is dynamic but at the same time the technology for measuring it keeps on changing as well, there are many improvements. As a consequence, there is no uniform continuous data from which class separability alone could be determined throughout the years.

For these reasons, the percentage of how much class separability is across different land cover classes by different sensors could not be uniformly assessed because of the improved progressive difference in the quality of data itself. Maybe apparent reduction of data quality can be made by applying a statistical ratio to all the data to make it uniform so that its separability throughout the satellite capture years could be determined.

FUTURE RESEARCH DIRECTIONS

The basic tenet for future research would have to be based on the main finding of this research which is that remote sensing and GIS and the proposed new method for the reconstruction of historical knowledge measured totally different things. For these two methods to be used interchangeably

for the investigation of land cover change for a particular geographical area there is a need to reconcile what each of them measures. The challenge is to make them measure the same thing, a good research topic for the future.

CONCLUSION

GOES great improvements from the earliest satellites to the present ones with more bands, so specific to weather trouble spots were monitored to assist in improved short-term forecasting. These had seen improvements on the satellite systems hardware themselves with better flexibility and more automatic ground stationed data acquisition elements such as river and rain gauges, seismometers, tide gauges, buoys, and ships weather stations.

Ever since the first satellites were launched in 1972 for Landsat System and 1986 for SPOT Satellites there has been tremendous amount of developments in platform and sensor for both system. These developments are directed towards a certain goal for each system. Landsat developments are more onto the refinement of spectral resolution variable through the improvements of the two sensors from mere 4 bands of the earliest systems to 7, 9 and 12 for the 2nd, 3rd and 4th generation. Landsat system also developments were in the improvements in the infra red more especially in thermal bands which had improved in both its spatial and spectral resolution. Also, generally these satellites have seen a slight improvement in spatial resolution and with the addition of panchromatic whereas its temporal resolutions have been maintained throughout (Figure 3). SPOT boost the very important characteristics of seeing stereo, therefore having 3-dimensions landscape creation. This also gave it increased revisits of one to four days. Although its spectral resolution are much lower 5 as compared to 12 of those of Landsat 5; it has had superior improvements in spatial resolution going from 10m, 5m, 2.5m and 1.5m for panchromatic and 20m, 20m, 10m and 8m for Multispectral from 1st, 2nd, 3rd and 4th

generation satellites respectively. Generally, SPOT maintained its temporal and spectral resolutions with slight improvements on its infra red spectra but huge strides were made in the spatial resolutions improvements (Figure 3).

The results of these show that the developments of GOES, Landsat and SPOT are not in competition of one another, but are complementary as each system has maintained its niche in geo-spatial space-view (Figure 3). Other systems like the IRS, VHRRS and RADAR satellites are becoming available and these are added to increased use of digital data.

Remote sensing digital data have shown tremendous development, but on the other hand, need for the human side of information reference services for the interpretation of these more sophisticated digital data increased. It has also been shown that the accuracy of these reconstruction to historical landscape are commensurate with that of remote sensing although work need to be done to harmonize these two inherently diverse data (Figure 2 and Table 1).

KEY TERMS AND DEFINITIONS

Archaeology: The importance of archaeology lies in the fact that it seeks to learn about culture from the fragmentary remains of the products of human activity (Deetz, 1992).

Biostratigraphic Markers: Biostratigraphy is a sub-discipline of sedimentary geology that relies on the physical zonation of biota, both in

time and space, in order to establish the relative stratigraphic position (i.e. older, younger, same age) of sedimentary rocks between different geographic localities.

Classification: The process of classification identified and assigned each pixel of all channels of the multi-spectral images to a particular class or theme based on the statistical characteristics of the pixel brightness values known as spectral signatures.

Electromagnetic Waves Energy: The electromagnetic (EM) spectrum describes the range of wavelengths of energy that can be recorded using remote sensing and it can be broadly divided (by increasing wavelength) into Gamma rays, X-rays, Ultra-violet light, Visible light, Infrared light, Microwave and Radio waves.

Geographical Information Systems (GIS): Geographical Information Systems (GIS) is defined as a technique which people employ using computers and specific computer software and hardware to locate physical features and describe their characteristics and condition on a raster based or vector co-ordinate based digital map by interrogating attribute data and to engage in spatial analysis, and this is a sound basis for informed decision making (Burrough & McDonnell, 1998).

Geo Spatial Science (GSS): Geospatial Science is a discipline that focuses on using information technology to understand people, places, and processes of the earth. Spatial analysis of human and physically variables is fundamental to the discipline. Remote Sensing, Geographic Information Systems, and Global Positioning Systems technologies are commonly used as measurement, observation, and analysis tools for this (Radford University, 2014).

Geo-Stationary: Geostationary satellite Platforms are platforms that revolve at speeds which match the rotation of the Earth so they seem stationary, relative to the Earth's surface. This allows the satellites to observe and collect information continuously over specific areas.

Geo-Synchronized and Sun-Synchronous: The platforms are designed to follow a north-south

orbit and in conjunction with the Earth's west-east rotation, they are able to capture the entire Earth's surface over a certain period of time. These satellite platforms orbits are often sun-synchronous: - They are able to cover each particular area on the Earth's surface at a constant local time of day. This ensures consistent illumination conditions for images of the same area that have been acquired at different times.

Land Cover Change: Land cover change forms a fundamental part of sustainable resource management. It is actually the main indicator of natural resource use.

Multi-Spectral: A multispectral image is one that captures image data at specific frequencies across the electromagnetic spectrum, the visible light range, and infrared. Spectral imaging sees beyond what human eye can perceive.

Panchromatic: Black and white aerial photograph or satellite images.

Platform: In order for the sensor to capture and record reflected or emitted energy from a target it must reside on a stable platform which can be on the ground (hand held camera), within the atmosphere (airplanes), and in space (the space shuttle or satellite).

Radiometric Resolution: The radiometric resolution of an imaging system describes its ability to discriminate very slight differences in energy.

Reconstruction of Historical Landscape (ROHL): *Reconstruction of historical landscapes* is defined as a method of building and mapping past landscapes by finding out how communities lived in a given historic period in a particular geographical area. This is achieved by identifying, reading and analysing marks made at the time and left behind from certain period. A historical landscape basically depicts a type of cultural landscape that contains, within a specific geographical area, both natural and human-made features that typify connected human activities, past events or patterns of physical development (Maphanyane, 2012).

Remote Sensing: Remote Sensing is the art, science, and technology of obtaining reliable information about physical objects and the environment through the processes of recording, measuring, and interpreting photographic images and patterns of electromagnetic radiant energy and other phenomena (Lillesand & Kiefer, 2004).

Sensor: Sensors are devices that functions like a human eye. They detect the reflected or emitted electromagnetic radiation from natural sources (Passive Remote Sensing) or detect responses from objects which are irradiated from artificially generated energy sources such as radar (Active Sensors).

Spatial Resolution: Spatial Resolution, Pixel Size, and Scale. With remote sensing instruments, the distance between the target being imaged and the platform, plays a large role in determining the detail of information obtained and the total area imaged by the sensor.

Spectral Resolution: Different classes of features and details in an image can often be

distinguished by comparing their responses over distinct electromagnetic wavelength ranges. Spectral resolution describes the ability of a sensor to define fine wavelength intervals.

Temporal Resolution: Temporal resolution: Other than: Spatial, Spectral and radiometric resolution; there is temporal resolution. This is the time it takes to image the exact same area at the same viewing angle a second time: Revisit Time.

Traditional Ecological Knowledge (TEK): The traditional ecological knowledge as a cumulative body of knowledge and beliefs, handed down through generations by cultural transmission, about the relationship of living beings with one another and with their environment. These are gained through the teaching of family history and cultural values. They have been recorded for thousands of years by storytelling, praise-singing, and songs as oral history, and are passed on to and learned by the descendants through the recitation of the narrative at events and during ceremonies (Berkes, Colding, & Folke, 2000).

Use of GIS and Remote Sensing for Landslide Susceptibility Mapping

Arzu Erener

INTRODUCTION

In recent years, geographical information systems (GISs) and Remote Sensing (RS) have proven to be common tools adopted for various studies in different scientific disciplines. GIS provides as a set of tools for the input, storage, retrieval, manipulation, management, modeling, analysis and output of spatial data. RS, on the other hand, offers earth observation data for thematic maps related to spatial studies. The use of GIS and RS data for landslide susceptibility mapping are demonstrated by three different landslide susceptibility maps with five different variables (Normalized Difference Vegetation Index (NDVI), Topographic Wetness Index (TWI), slope; lineament density and distance to roads). The comparison of the generated final susceptibility maps with historical landslide locations is given with important factors affecting the accuracy of susceptibility map. The accuracy analysis of the final susceptibility maps for various weighting strategies is performed. The results indicate that assignment of weights to the slope parameter impacts the accuracy in the high susceptible zones.

BACKGROUND

Landslides are among the most common natural hazards and are the most damaging, leading to

substantial economic, human, and environmental losses throughout the world. The quantitative assessment of landslide hazards for a large area is critical for mitigation of the associated risks. They are often triggered by natural phenomena and/or human activity, such as earthquakes, precipitation, erosion, deforestation etc. and are difficult to predict. One of the greatest limiting factors in predicting and mapping landslide activity is the lack of understanding of scale-dependent processes, such as erosion, weathering, and fracturing (Glenn et al., 2006). Such maps normally aim at providing a document that depicts the likelihood or possibility of new movements occurring in an area, and therefore helping to reduce future damages. To express the potential for occurrence of landslides in a quantitative manner, maps must incorporate the concept of probability, which is an assessment of the relative frequency of occurrence (Ohlmacher & Davis, 2003). Susceptibility expresses the likelihood that a landslide will occur in an area on the basis of the local terrain conditions (Soeters & Van Westen, 1996); return period or annual probability of occurrence is not considered. The main difference between susceptibility and hazard is therefore that the latter considers the temporal factor, by estimating the probability of occurrence of the phenomenon within a specified period of time (Varnes, 1984) whereas the former considers the likelihood of landslide occurrence. There are many studies in the literature about use

DOI: 10.4018/978-1-5225-2255-3.ch304

of GIS to evaluate landslide susceptibility (e.g. Gokceoglu et al. 2005; Akgun et al. 2011; Akgun 2012; Pradhan et al. 2013; Kavzoglu et al. 2013)

MAIN FOCUS

The purpose of this study is to apply the grid based GIS techniques for landslide susceptibility mapping using five different factors including Normalized Difference Vegetation Index (NDVI), Topographic Wetness Index (TWI), slope, lineament density, and distance to roads. The scope includes the preparation of landslide susceptibility map to identify highly susceptible areas and, the accuracy assessment related to the obtained maps.

The susceptibility assessment methodology is demonstrated for More and Romsdal region in Norway (Erener & Duzgun, 2010). The study area occupies approximately 606.755 km² in the west part of Norway. The upper left coordinates on 112707,770408 m - 6952112,603469 m and lower right coordinates 6929466,479194 m -144909,272731 m respectively (Figure 1).

Method of Study

An empirical approach is used to map and evaluate landslide susceptibility. In this approach a

grid based GIS is adopted to construct a landslide susceptibility map. Five layers of data with 30 × 30 m resolution grid were superimposed to create the landslide susceptibility map. Slope is given the most emphasis, followed by, TWI, NDVI, lineament density and distance to roads. A numerical rating system is applied and each of the five factors is grouped into three categories, and each category is assigned a value between 1 and 3, with 1 being least susceptible and 3 most susceptible to landslides. Based on their relative importance to slope instability in the study area, the five factors are assigned weights between 0.0 and 1.0 (collectively adding to 1.0). A raster-based GIS is used to overlay the five layers with 30 × 30 m resolution and calculate a Landslide Susceptibility Index (LSI) for each individual cell. The final map shows areas of low, medium, and high landslide susceptibility. The method of the study is shown in Figure 2.

Scale and properties of the data used in the study for susceptibility mapping is given in Table 1. Before beginning the processes, the water areas are masked from the layers. Vector based 50 meters contour interval topographic maps, provided from the Geological Survey of Norway (NGU), are the main data used in the study (Figure 3a). DEM data are generated from maps with a cell size of 30 m using triangular irregular network. The

Figure 1. Study region (parts of figure adopted from NGI)

Figure 2. The method of the study

Table 1. Data scale and properties

Classification	Sub-Classification	GIS Data Type	Scale or Grid Size
Geological Hazard Map	Landslide	Point Coverage	1/500 000
Basic Map	Elevation	Line Coverage	1/100000
	Slope	GRID	30*30
Derived Maps	Topo. Wetness Index	GRID	30*30
	Lineament	Line Coverage	1/100 000
	Vegetation Index	GRID	1/100 000

result of the generated DEM includes the highest and the lowest elevation 1807.46 m-13.7282 m, respectively (Figure 3b).

The vertical accuracy of the DEM data are tested with root-mean-square error (RMSE) statistic. For this test some principles suggested by USGS are used. According to USGS National Mapping Program Technical Instructions, a representative sampling of test points is used to verify the accuracy of any category of DEM. A minimum

number of 28 test points per DEM is required (20 interior points and 8 edge points) (USGS).

The vertical RMSE is defined as:

$$RMSE = \sqrt{\frac{\sum (z_i - z_t)^2}{n}}$$

z_i = interpolated DEM elevation of a test point

z_t = True elevation of a test point

n = number of test points.

Figure 3. Contour map (a), DEM data of the area (b) categorized slope map of the area (0-25=1; 25-50=2 and 50-84=3)

Accuracy is computed by a comparison of interpolated elevations in the DEM with corresponding measured elevations from the topographic map. The total vertical RMSE is found 2.30 meter which is quite admissible within the accuracy requirements of the study.

Slope, which measure of the steepness of an area on the Earth's surface, is the most important factor to affect the landslide occurrence (Lee & Min 2001). The steeper the slope, the more likely it is to slide. The slope map is derived from the DEM of the study area. The slope layer has values ranging from 0° to 84.55° . The slope image is then classified into three slope angle classes (0-25=low, 25-50= moderate and 50-84.55=high), and each class is assigned a value between 1 and 3, with 1 being least susceptible and 3 most susceptible to landslides. The result is shown in Figure 3c.

The TWI has been used extensively to describe the effect of topography on the location and size of saturated source areas of runoff generation. TWI is a function of both the slope and the upstream contributing area per unit width orthogonal to the flow direction. The calculation of the wetness index is based on logical ideas of down slope water movement and accumulation of water at the base of slopes and in depressions or swales where there is convergence of flow (Kokkila, 2002). TWI is calculated using the following expression:

$$TWI = (As/\tan \alpha)$$

where, As is the specific catchments area and α is slope angle. For TWI fill sinks operation (Figure 4a), flow direction (Figure 4b), flow accumulation (Figure 4c) operations are applied to the DEM data. Resultant map of the TWI is given in the Figure 4d.

The result of the TWI is categorized into three classes by using natural breaks algorithm. This is done by seeking to minimize each class's average deviation from the class mean, while maximizing each class's deviation from the means of the other groups. In other words, the method seeks to reduce the variance within classes and maximize the variance between classes (Jenks, 1967). TWI categorization was performed by considering the high slope areas doesn't keep rain and has less susceptibility however hollow area keeps more water has high topographic index showing high susceptibility to landslide. For this reason, low index values between 1.08-5.86 areas are given a score (1) showing low susceptibility; medium index values between 5.86–8.70 are given a score (2) showing medium susceptibility and, finally high index values between 8.70-20 are assigned a score (3) showing high susceptibility. The result is shown in Figure 4e.

The lineament density of the area has a significant influence on the occurrence of landslides. Lineament density is also used in landslide hazard assessment (Atkinson & Massari 1998; Sarkar & Kanungo 2004; Suzen & Doyuran 2004) as it is

Figure 4. Topographic wetness index generation steps: fill sinks operation 4 (a), Flow direction (b), flow accumulation (c) wetness index is (d) and reclassified topographic index (e).

generally considered the probability of landslides occurring is greater in highly fractured areas compared to those with a lower fracture density. In the study lineaments are extracted from Landsat ETM image by using line option of PCI Geomatica software. Band 7 with a spatial resolution 30x30 meter is selected for the extraction of the lineaments considering the purpose of this study; since this band is useful for discrimination of lineaments and other geological features such as mineral and rock types and is also sensitive to vegetation moisture content (Sabins, 1996). The results of the automatically extracted lineaments are given in Figure 5a. Spatial density of the linea-

ments of the area is determined and this density again categorized into three classes. Low dense lineament between 0-0.29 is considered as least susceptible areas and scored with (1); Medium dense lineament between 0-0.63 is scored with (2), density of lineament higher than 0.63 being most susceptible to landslides is scored with (3) which result is shown in Figure 5b.

The external factors such as road construction also contribute to occurrence of the landslide. For that reason, the road network of the study area also is taken into consideration as a triggering factor. The road map of the study area is provided from NGU in a vector format (Figure 5c). The highest

Figure 5. Lineament map of the study area (a); Lineament density map (b); Road network of the study area (c); Buffered and Reclassified road network of the area (d), Vegetation Indices (e)

susceptible areas closest to road in 200m buffer area are given high susceptibility score (3). Road between 200-400m buffer area given medium susceptibility score (2), Road buffer >400 m is given low susceptibility score as shown in (Figure 5d).

The NDVI is produced using 4th and 3rd bands of Landsat ETM data the water areas are excluded from the map by using masking operation. The resultant map is grouped into three class and densely vegetated areas ranges with NDVI values between 0.33-0.98 and given score of 1; Medium dense areas with NDVI values between 0.12-0.33 are scored as 2; Low dense areas with NDVI values less than 0.012 scored as 3. Showing 1 as least susceptible and 3 as most susceptible to landslides, the results are illustrated in Figure 5e.

SOLUTIONS AND RECOMMENDATIONS

Final Map Generation

In order to generate landslide susceptibility map; a numerical rating system is applied to five factors that contribute to landslide occurrence: slope, TWI, NDVI, lineament density and distance to roads. Each of the five factors is grouped into three categories, and each category is assigned a value between 1 and 3, with 1 being least susceptible and 3 being the most susceptible to landslides. Scoring for slope, NDVI, and lineament density is based upon previous studies, which showed that higher slopes, less vegetation, and denser lineaments increase landslide susceptibility (Sarkar et al., 1995; Pachauri et al., 1998). The landslide

casual parameters are weighted by means of direct, pair-wise, and rank ordering comparison and the output is a composite index map (Castellanos and Van Westen 2007). Based on their relative importance to landslide occurrence in the study area, the five factors are assigned weights between 0.0 and 1.0 (collectively adding to 1.0). Slope is assigned the highest weight, followed by TWI, NDVI, lineament density and distance to roads. Different weights are assigned to five different layers as a result of weighing operation each weights produced different landslide susceptibility map. In order to define most suitable landslide susceptibility map of the area the accuracy of the generated map is tested with the previously defined landslide data which is shown in the accuracy assessment section in Table 3

Performance Evaluation of Final Susceptibility Maps

The accuracy of the three final landslide susceptibility maps are evaluated by using the GIS overlay analyses. For this operation a buffer zone of 30 m. is assigned to the previously defined real landslide data. 30m buffer is selected due to 1

mm shift at the location of the landslide locations on the map, which should always be considered because this amount is almost thickness of the pen used for producing landslide locations on the topographic map.

Accuracy of the results largely depends on the selection of the buffer amount. A small buffer will result in matching few landslide locations. In this study, different values for the buffer are tested. Larger buffer sizes intersect with nearly all highly susceptible zones. For this reason the amount of buffer is kept minimum, which is equal to the pixel size of the maps. Three different weighting is applied in this study in order to see the effects of the weights to the final map (Table 2). The results show that: generally, the medium susceptible areas show the highest accuracy as map 1 (Figure 6c) gives 70% (Table 3), map 2 (Figure 7c) and map 3 (Figure 8c) gives 95% accuracy (Table 3). The highest susceptibility accuracy is obtained in the map 2, it may be due to a weight factor of 40%, which is assigned to slope. It can be concluded that the weighting factors assigned to map 2 gives the better estimate of susceptible regions in the study region.

Figure 6. Results of final map 1 (a); High risky areas intersect with landslide points (b); Results of final map 3; Medium risky areas intersect with four landslide point s(c), and Low risky areas intersect with four landslide points (d)

Table 2. Weighting factor used for map 1

Data Layers	Slope Gradient	Topographic Index	Vegetation Index (NDVI)	Lineament Density	Road Networks
Weighting factors of map1	0,3	0,25	0,2	0,15	0,1
Weighting factors of map2	0,4	0,3	0,15	0,1	0,05
Weighting factors of map3	0,35	0,15	0,15	0,25	0,10

Table 3. Accuracy of map 1, 2, and 3

	Total Landslide Points	Matching Points With Most Susceptible Areas	Matching Points With Medium Susceptible Areas	Matching Points With Less Susceptible Areas
Map 1	20	5	14	9
Accuracy		40%	70%	45%
Map 2	20	14	19	7
Accuracy		70%	95%	35%
Map 3	20	12	19	9
Accuracy		60%	95%	45%

Figure 7. Results of final map 2 (a); High risky areas intersect with landslide points (b); Results of final map 3; Medium risky areas intersect with four landslide point s(c), and Low risky areas intersect with four landslide points (d)

The proportions of susceptibility zones of the whole region are calculated. High risk zone is reached the maximum value (97.01 km²) in the Map 2. Minimum High risk zone value (41.26 km²) is in the Map1 as shown in the Table 4.

FUTURE RESEARCH DIRECTIONS

In this study it is aimed to focus on use of GIS and RS data for landslide susceptibility mapping. In order to discuss the performance of the study,

Figure 8. Result of Map 3 (a); High risky areas intersect with landslide points (b); Results of final map 3; Medium risky areas intersect with four landslide points (c), and Low risky areas intersect with four landslide points (d)

Table 4. Proportions of susceptibility zones to the whole region

	Area km ²			Proportion%		
	Low	Medium	High	Low	Medium	High
Map1	89.88	215.67	41.26	14.81	35.55	6.80
Map2	75.16	166.39	97.01	12.39	27.42	15.99
Map3	96.85	170.57	87.46	15.96	28.11	14.415
Total Region	606.76	606.76	606.76			

three different weighting factors were evaluated. The weights were obtained from a single landslide expert. The study may be extended in the future by preparing a survey to different landslide experts in order to obtain the weights. This may provide the researcher how the expert knowledge affects the performance of the susceptibility mapping (Wang, 2008). Another issue is the factors handled in the study. In this study five different factors are used in order to obtain the susceptibility maps. It is worth to study the influence of inclusion of different factors to the susceptibility mapping in the future. One other issue may be to evaluate the quality of the factors. Factors may involve uncertainty and

their propagation in susceptibility mapping should be analyzed in order to determine uncertainty in the obtained maps in a systematic way.

CONCLUSION

In the present study, landslide susceptibility mapping using combination of various factors responsible for landslide susceptibility is presented. Each factor has relative importance to probable landslide activity. A reliable and accurate susceptibility map depends on the inclusion and proper determination of the role of these parameters.

The accuracy of the generated maps can change according to the buffer size applied on the previously occurred landslide test points. Large buffer size will provide higher accuracy so it is a critical value and subjective process. The result of generated three different landslide maps according to five different variables assigned with different weight factors show that different weights result in different susceptibility maps. The comparison of the generated final susceptibility maps with previously occurring landslide points shows that the most important factor affecting the accuracy is the slope of the study area. This signifies that the weight assigned to the slope generate the highest accuracy in the high risk zones. Results of this study suggest that GIS and RS can effectively be used to compile data and overlay several data layers relevant to landslide susceptibility mapping.

KEY TERMS AND DEFINITIONS

DEM: Digital Elevation Model is the 3D representation of a terrain's surface.

GIS: Geographic Information Systems is a technology that is used to capture, store, manipulate, analyze, manage, and present spatial data.

Landslide Susceptibility: Landslide susceptibility is investigating the spatial likelihood of occurrence of landslides by correlating principal factors with landslide inventory data.

NDVI: Normalized Difference Vegetation Index is a most well-known index to detect vegetation and their condition in an area by using bands of remote sensing data.

RS: Remote sensing is the acquisition of information from earth without making physical contact with the object by using satellite- or aircraft-based sensor technologies.

TWI: Topographic Wetness Index describes the effect of topography on the location and size of saturated source areas of runoff generation.

Weighting Factors: Weighting Factors are estimated impact of values indicating relative importance.

Accessibility in E-Government

Christian Sonnenberg

Florida Institute of Technology, USA

INTRODUCTION

Access to government-created digital content has come a long way since the early days of the Web. The growth of Internet usage coupled with advances in technology and reduced costs has made the use of Electronic Government (E-Government) resources and websites a primary means of content access for citizens in the United States. According to the latest census and national records, over 86% of the US population has access to the Internet with a continued growth rate of 7% from the previous year. (Internet Users by Country, 2014) However, as illustrated by the Healthcare.gov website launch in 2013, technological, accessibility, and usability issues can seriously hinder and cause detrimental effects for user relying on these services. How content is presented and delivered on the Web makes an impact on how effective and helpful it is, but even more so for users with disabilities. This paper will cover the methods and standards of digital government content, the compliance with accessibility guidelines for disabled users, current challenges, and possible avenues of future delivery methods.

Web accessibility as defined by the World Wide Web Consortium (W3C) is the means by which anyone regardless of physical or cognitive disability can use and operate a website (W3C Introduction to Web Accessibility, 2005). People with disabilities or normal aging considerations find it difficult if not impossible to use technology that nondisabled individuals could use freely. For example, a blind user visiting a website must rely on screen-reading technology to interpret the site while a nondisabled user can browse it without any additional assistance. In order to achieve accessibility in their websites, a number of rules

and guidelines have been developed by the federal government. In 1998, congress amended the Rehabilitation Act of 1973¹ with Section 508 to require federal agencies to make electronic and information technology accessible to people with disabilities. Section 508 was enacted to eliminate barriers in electronic and information technology by requiring that disabled users have access to government information that is comparable to the access available to others without disabilities (www.section508.gov).

While accessibility focuses on the ability for all users, regardless of disability, to interact with content, another attribute is also important. Usability is how effectively, efficiently and satisfactorily a user can interact with a user interface (Chou & Hsiao, 2007). A focus on usability implies that a site is designed for easier access of content and information, which affects all users. The International Organization for Standardization (ISO) interprets usability as effectiveness, efficiency and satisfaction with which the user achieves specific goals in the specified context of use (ISO, 1998). Although not as strictly defined or required like Section 508, The U.S. Web Design Standards were developed as the U.S. government's very own set of common components and designs for websites. It's structured to make things easier for government site developers, while raising the bar on what users expect from their digital experience. Many of these standards are built upon the existing section 508 standards in hopes of taking them one step further.

Since the adoption of Section 508, compliance has been slow, but steady. However, technology advances quickly, and with it comes new challenges and concerns that were not considered in the original requirements. The advent of the

DOI: 10.4018/978-1-5225-2255-3.ch305

mobile revolution has highlighted an accessibility dilemma with web sites that were never intended for use on small devices. With global mobile phone use at an all-time high, developers are racing to adapt content to fit these new screens. It is important to understand the current criteria put down in Section 508 to define accessibility standards, what constitutes compliance, and what updates need to be applied to accommodate for the advent of mobile usage. Furthermore, advances in mobile technologies and the shift to mobile app usage have raised additional questions, such as how the platform can become an interactive, dynamic process rather than the traditional passive distribution of content. Generating greater user engagement that translates into information access, service utilization, and participation in government decision helps both empower the user and provide valuable feedback to the government. Usability and accessibility will present challenges to citizens' acceptance and adoption of more advanced services and will influence their day-to-day interactions with e-government websites (Clemmensen & Katre, 2012).

BACKGROUND

The design and accessibility of government websites today is driven by a particular set of criteria known as Section 508. This amendment, which went into effect in June 2001, requires all federal agencies to comply with accessibility standards administered by the Architectural and Transportation Barriers Compliance Board (referred to as the Access Board)². These standards ensure that electronic and information technology is accessible to disabled persons to the extent it does not pose an "undue burden" on an agency. When Section 508 went into effect, federal agencies could no longer procure noncompliant electronic and information technology (Charles, 2001). Therefore, vendors who supply hardware, software, web sites, and other information technologies, have to ensure

compliance with Section 508 in order to be eligible for government contracts. The original standards were organized into three areas including: accessibility of operation and information, compatibility with peripheral devices, and documentation and services associated with electronic and information technology. Although mobile devices and tablets are not specifically listed, the inclusion of "web sites" as information technology necessitates that they be accessible regardless of the target output, whether it is desktop or mobile.

The U.S. Access Board's Section 508 web site summarizes each section of the technology standards as they apply to users with disabilities. These standards focus on assistive technologies (such as screen reader devices for blind users) and alternative technologies (e.g., keyboard navigation instead of mouse navigation) that allow access to those with disabilities. However, not all standards can be broadly applied to every device that accesses the Web. Established in 2000, the original Section 508 standards have become antiquated with current technology. While the standards were intended for traditional desktop websites, they were not considered for mobile sites. Since 2006, the Access Board has attempted to update these guidelines to account for new technologies (2006). On February 18, 2015, the Board released a proposed rule updating the 508 Standards and the 255 Guidelines. The Board held public hearings on the proposed rule in San Diego, Washington, DC and Salt Lake City. However, as of November of 2015 no official changes have been enacted (U.S. Access Board, 2015).

WEB ACCESSIBILITY

It is important to understand the history that drives Section 508 and the changes being put into place by the current proposal. The W3C, as the standards setting body for the Web, provided support to the Web Accessibility Initiative (WAI) in the development of Web Content Accessibility

Guidelines (WCAG) (Chisolm, Vanderheiden, & Jacobs, 2001). The original 1.0 version of these guidelines forms the foundation for the Section 508 Web accessibility standard. The WAI guidelines for Web content accessibility focus on making online information accessible to those with disabilities. This includes text, images, links, audio, and other elements that compose a Web page or application. One such example of these guidelines is as follows:

1194.22 (a) A text equivalent for every non-text element shall be provided. Pictures, graphs, and other elements on a Web page not in electronically readable form are supplemented with a text description to be read by screen reader software and Braille displays.

Such guidelines clearly present the issue at hand, such as users with vision impairment, followed by the solution, text alternatives for screen readers. Such rules that are not device or context specific can be safely applied to mobile sites because the technology exists to interpret text descriptions of images regardless of platform. However, other rules have not aged as well. For example, the following rule stipulates the inclusion of plug-in sources:

1924.22 (m) When a web page requires that an applet, plug-in or other application be present on the client system to interpret page content, the page must provide a link to a plug-in or applet that complies with §1194.21(a) through (l).

While this is fine for a desktop environment, a mobile device is typically limited in the plug-ins available. Even if a link is provided, it may not be operational with said device and the user will be unable to retrieve the document. Apple devices, for example, will not run content that requires a Flash plug-in. An alternative guideline might stipulate the need for external documents to be made available in formats accessible by the target device.

For a full list of the WAI guidelines, please see the WCAG 1.0 guidelines available at <http://www.w3.org/TR/WCAG10/>.

WEB USABILITY

While the Section 508 guidelines focus primarily on accessibility rules, they also affect usability. Evidence from some studies suggests that e-government websites can benefit from a high level of usability in at least two ways. First, an e-government website provides a first impression of a government and its online services. Therefore, to foster good will and active participation with constituents, an e-government should aim for user-friendliness (Baker, 2009). Second, usability improves users' performance, making interactions more efficient, as well as increasing citizens' satisfaction with e-government (Verdegem & Verleye, 2009). One study identified a number of usability issues on e-government websites such as "links show different colors", "difficulty in using online help", and "categories without a logical order". This study suggests that usability issues can potentially hamper the adoption rate of such sites (Huang & Benyoucef, 2014).

Although the Section 508 guidelines do have tangential influence on usability, they do not address it specifically. The U.S. Web Design Standards were created as a collaboration between 18F and the U.S. Digital Service (USDS) to fill in the Section 508 gaps, under the guidance of an advisory board from the CFPB, FDA, DVA, SSA, IRS, and the Department of Education. They incorporate specific UI components on an HTML foundation, utilizing a technique called "progressive enhancement" to deliver the same core content regardless of target platforms. Included in these guidelines is a visual style guide that defines typography and color recommendations that are 508 compliant and designed for readability. They also incorporate common UI components and patterns, a collection of foundational interface elements for all U.S. government sites. (U.S. Web Design Standards, 2015)

MOBILE ACCESSIBILITY FACTORS

The WAI guidelines that Section 508 relies on were originally intended to be broad enough to cover any viewing device. However, these guidelines were put in place before mobile devices became a major consumer of Web content. Mobile devices present a number of issues and concerns that may not be adequately addressed by the current Section 508 standards.

One of the most important factors affecting handheld devices is screen size. Mobile devices are mobile because they are small in form factor, but only a limited amount of information can be displayed at any given time. Studies show that comprehension of handheld content is dramatically lower than desktop counterparts (Singh, Sumeeth & Miller, 2011). Input is another factor as touch screens have issues regarding precision and manipulation. Hands are not well adapted to handle small screens where the space between buttons is minuscule (Siegenthaler et al., 2012). These factors become magnified for users with a disability such as poor vision or cognitive limitations. For example, accuracy demands are much higher on smaller screens, forcing users to precisely select buttons that might normally be bigger on a desktop interface. As alternatives are often limited in the mobile environment, it is very important that mobile sites be designed to limit or remove problematic content.

Ideally, mobile web sites are ones that have been specifically crafted for mobile devices. This allows developers the chance to reengineer a site to better align with the context of mobile usage by eliminating extraneous content. In practice, an agency may find it difficult to spend the manpower necessary to make a separate mobile site, in addition to the original desktop site, simultaneously ensuring that both comply with Section 508. On the other hand, mobile-specific web sites are generally more compliant with Section 508 because they have removed so much content in the first place.

The simplicity of a mobile site lends itself well to accessibility compliance, but it requires addi-

tional effort on the part of the agency. A number of adaptation mechanisms have been developed over the years to try and alleviate the development burden. Segmentation, summarization, and filtering are popular techniques used to take existing desktop sites and make them usable on handheld devices. One such mechanism invokes a method of analyzing site metrics to identify important content and displaying it first (Sonnenberg, 2013). These metrics consider such factors as semantics, location, context, and user preferences and then restructure the entire site to provide enhanced usability to each particular user. These metrics could be further extended to consider additional disability requirements, allowing a certain degree of accessibility compliance.

LOCALIZATION AND PERSONALIZATION

One of the most useful attributes of mobile devices is their access to position and location information. This allows the device to tailor its usage to the context of the user. For example, GPS information can be used to determine how close a person is to the nearest government facility with the services they need. This also allows for dynamic personalization of the user experience, incorporating context and location to create a unique experience to cater to specific constituents (Ekelin & Eriksén, 2015).

As an accessibility feature, localization can be used as a means of redefining the user experience within the context of a disabled user. Therefore, it is worth considering incorporating such features when applicable into the Section 508 guidelines. If location information is available, a user with disabilities could be provided with audio or visual cues to highlight their surroundings and get their bearings. Furthermore, the ability to collect location information gives e-government content providers more information about their constituents' behavior and focus. This in turn allows them to build more robust and meaningful websites.

WCAG 2.0 UPDATES

Though there are methods of applying Section 508 to mobile web sites, the main issue is that Section 508 is simply not designed for them. The WCAG 1.0 guidelines were established in 1999. Since then the Web has undergone tremendous changes in the methods of content display and presentation. In 2008, W3C created the new WCAG 2.0 guidelines to accommodate these new developments (Reid, Snow-Weaver, 2008). As of November 2013, federal agencies and government websites are still only required to conform to Section 508 guidelines, itself a representation of WCAG 1.0 principles. However, these guidelines are currently being updated by the Telecommunications and Electronic and Information Technology Advisory Committee (TEITAC) to conform to the new WCAG 2.0 standards (U.S. Access Board, 2015). While the debate is still ongoing, it is important to understand the critical differences between WCAG 1.0 and 2.0 and how that affects Section 508.

The WCAG 2.0 standards were developed to reduce the device dependency of WCAG 1.0 and present technology-independent guidelines. This is important as the Web is now accessed from a myriad number of devices. These standards apply more broadly to technology in general and were designed to be applied to future devices as well (Alonso et al., 2010). WCAG 2.0 is also designed to be more precisely tested and evaluated. It allows for easier automation in testing and integration into design specification.

The evaluation of conformance metrics of WCAG 2.0 differ from 1.0 in the newly created “success criteria.” Originally, 1.0 utilized checkpoints to verify conformance. The new 2.0 standards present three layers of conformance criteria ranked A (lowest), AA, and AAA (highest) (Keith, Floratos, & Whitney, 2012). The highest levels of conformance are typically the most difficult to adopt, but provide the highest degree of assured accessibility. These layers of conformance allow for a greater degree of flexibility in evaluation.

The Section 508 update is slated to implement levels A and AA requirements from the WCAG 2.0 guidelines, which is considered in line with the global standard. Section 508 will also broaden the definition of information technology to more readily handle the advancements of technology in the future (U.S. Access Board, 2013). The W3C have also come up with a number of best practices regarding mobile specific web sites. While not all of these recommendations are necessary, it is planned to incorporate these guidelines into the Section 508 updates. For a more detailed look at these guidelines please visit the W3C site: <http://www.w3.org/TR/mobile-bp/>.

WEB ACCESSIBILITY COMPLIANCE

Since the adoption of Section 508, overall compliance has been sporadic. Stowers (2002) conducted a study on 148 federal Web sites and found that only 13.5% of the sites met the accessibility standards of Section 508. In the years following the release of Section 508, improvements were made in the area of compliance, specifically with the introduction of support tools such as the W3C Markup Validator Suite. These tools provide automated feedback on noncompliance errors associated with the Web content accessibility guidelines. W3C also provides a markup tool specifically designed for mobile devices (W3C, 2013).

However, in recent years, compliance rates have drastically dropped down to and below the original adoption rates. One study by Olalere and Lazar (2011) tested 100 popular US Government websites and discovered that 90% of home pages were in breach of Section 508. The issues discovered on these websites were varied, largely relating to a lack of sufficient alternative text for images and a lack of captions on video. These studies also reveal a lack of compliance across sites regardless of device, be it desktop or mobile.

The overall drop in compliance can be attributed to a number of different factors. New

browsers, devices, and platforms increase the chance of failure, as websites are ill-prepared for translation to these permutation (Duchateau, Boulay, & Burger, 2010). The growth in the number of websites is another contributing factor. Since 1999, the number of total websites has to over 4.37 billion indexed pages as of 2015 (World Wide Web Size, 2015). Lastly, as stated previously, Section 508 has not been formally updated in years and agencies may feel their limitations stifle usage in the current Web environment.

Although the current situation may appear alarming, the U.S. Government is refreshing Section 508 to make it more closely aligned with version 2.0 of the WCAG (U.S. Access Board, 2015). Studies also show that small number of rules cause a disproportionate number of failures in websites (Reid, Snow-Weaver, 2008). Improvements in compliance metrics could be achieved by prioritizing these in the new WCAG 2.0 layered approach. Once WCAG 2.0 principles are incorporated into Section 508, it is likely to lead to accessibility improvements across all e-government websites.

MOBILE ACCESSIBILITY INITIATIVE

In an effort to promote and deliver mobile access to government employees and constituents, the U.S. General Services Administration (GSA) has launched an initiative called Mobile Gov (GSA Mobile Government Toolkit, 2015). One of Mobile Gov's primary objectives is to provide services and information to the public regardless of how they access it. GSA created HowTo.gov to support agencies in developing mobility presences, whether it is a web site or application, and provides procedures to maintain Section 508 compliance.

A number of applications have arisen from this initiative. One such example is the Transportation Security Administration (TSA) "My TSA" app designed specifically for mobile devices. This app provides answers to common questions such as what items are allowed on flights, security

wait times, and other regulations. The "My TSA" mobile application is completely accessible for people with disabilities and meets the full U.S. Section 508 compliance standards. While this is an application, as opposed to a web site, the lessons learned can be applied to both domains.

MOBILE QR INTEGRATION

One particular method of interaction has been gaining traction as a method of improving e-government accessibility and usability. Quick Response (QR) codes are a type of matrix barcode (or two-dimensional code) that are much faster than traditional UPC barcodes. These codes can be scanned and read by a QR-Code reader, software that is installed on most mobile devices (Mobile Barcodes.com, 2012). QR codes provide a cheap, easy, and secure method to transmit information in a "push" format to individuals. QR codes, when appropriately used, can serve as a way of enhancing the scope and scale of government services and there is a growing push for mobile barcodes in the government sector (ICMA, 2010). Since QR codes are easy to read and generate, they promote real-time data sharing of government content. They also make data entry and data management easy from an administrative perspective.

QR codes have interesting possibilities for users with disabilities. One particular use for QR codes in e-government is the way pointing systems in national parks. While navigating park trails, visitors might get lost and not be able to get a cell signal. QR codes on trail markers can help hikers get their bearings in the events of disorientation or a GPS failure. The trail markers have QR codes that have coordinates to a map already contained within the parks application on the device. (Lorenzi et al., 2014) This may tremendously help users with cognitive disabilities.

QR codes were established as an ISO (ISO/IEC18004) standard and are capable of handling many types of data, such as numeric and alphabetic characters, symbols, binary, and control codes. QR

code data capacity varies based on data type but they can encode a website URL, video links, social media links, geo-coordinates, email addresses and messages, purchase links, and many others. Data can even be restored even if the symbol is partially dirty or damaged (Lorenzi et al., 2014). QR codes are capable of omni-directional, high speed reading, making them a very robust tool to empower mobile users. Perhaps the most important benefit of QR codes is that they exist as an alternative for devices that may be limited in interaction. For example, blind users can “read” the surroundings with such a device and not worry about interactions with the screen of the device. Therefore, it is worth considering incorporating the QR code and specific standards in their use into the upcoming Section 508 updates.

FUTURE COMPLIANCE

Compliance with Section 508 is improving with the advent of resources and tools provided by government, nonprofit organizations, academic institutions, and commercial vendors. The WAI guidelines provide important information about each accessibility barrier and potential solutions to it (2006). The University of Melbourne has provided a checklist for Level AA compliance with WCAG 2.0, which may prove useful when Section 508 formally adopts the standard (2015).

However, accessibility compliance has not reached its full potential. As compliance rates stagnate, the standards become out of date with each passing year. A number of 508 guidelines are too rigid or difficult to interpret in today’s environment. New technologies and languages that were not considered at the foundation of Section 508 need to be considered more closely as well. For example, QR codes and GPS localization provide alternative solutions to mobile interactions and should be highlighted to inform developers and agencies.

Research has suggested that a rating system for “no,” “partial,” or “full” compliance, as well

as, an identification component for whom the site is accessible, would be beneficial to the Section 508 guidelines (Jaegar, 2004). This trend is finally seeing fruition with the new WCAG 2.0 Layer approach. Government sites will be categorized by low or high compliance according to how strict they adhere to each layer. With amendments that accommodate these issues, Section 508 should see a much greater adoption rate in the future.

CONCLUSION

Section 508 has certainly made headway in bridging the digital divide, especially for those with disabilities. It has provided the structure for building e-government sites properly and accessible to all citizens. However, automated technologies and checker systems alone will not improve compliance with Section 508. These tools can only guide the developer through an accessibility assessment and may not uncover barriers related to meaningful content. In addition, the growth and advancement of mobile technology and new design techniques has caused Section 508 to become outdated.

Significant changes must be made to accommodate the growth in technology and the mobile environment. Section 508 is in the process of being updated, incorporating a number of features from WCAG 2.0 to counter the weaknesses of its current iteration. These improvements, coupled with initiatives to foster proper mobile web design, will provide agencies with a much better solution towards improving accessibility across all government web sites.

KEY TERMS AND DEFINITIONS

Assistive Technology: Equipment, device, or other product that assists a disabled user in performing tasks that otherwise would be difficult or not possible to accomplish.

Color Deficiency: Color deficient vision results in an inability to distinguish certain colors and shades when compared to normal vision.

Digital Divide: The digital divide is the gap between those who have access to electronic and information technology and those who do not.

Electronic and Information Technology: Information technology and any equipment or interconnected system or subsystem of equipment used in the creation, conversion, or duplication of data or information (www.access-board.gov).

Mobile Device: Any handheld technology that allows the user to operate the device in transit. This includes such items as smartphones and tablets.

Motor Disabilities: Physical impairments that can impede movement, coordination, or sensation. They can include weakness and lack of muscle control.

Quick Response (QR): Matrix barcodes used by mobile device cameras to interpret localized information.

Screen Reader: Speech synthesis software used by a vision-impaired person to read aloud what is displayed on a computer screen.

Section 508: Amendment to the 1973 Rehabilitation Act requiring federal agencies to make electronic and information technology accessible to people with disabilities.

Web Accessibility: Web accessibility means that a person, regardless of disabilities, is able to use Web technology without encountering any barriers.

ENDNOTES

- ¹ Rehabilitation Act of 1973, *as amended by* § 508, 29 U.S.C. § 794(d) (1998).
- ² Architectural and Transportation Barriers Compliance Board is an independent federal agency, established by Section 502 of the 1973 Rehabilitation Act. Its primary function is to promote accessibility for individuals with disabilities.

The Adoption and Transformation of Capability Maturity Models in Government

Terry F. Buss

Carnegie Mellon University, Australia

INTRODUCTION

The Information Technology (IT) field has long been criticized as having problems with the quality of goods and services it produces. Gartner in its annual “Assessment of IT Practices” observes that about three-fourths of software projects “failed,” judging on cost, reliability, usability and timeliness.

Organizations, concerned about quality, stimulated the creation of models, frameworks or approaches that would “improve the quality” of the goods and services produced. Carnegie Mellon University’s (CMU) Capability Maturity Model (CMM), along with numerous subsequent competing and complimentary approaches, was launched to fill this need. CMM was developed for the US Department of Defense (DOD), making it a major quality improvement tool in government.

CMM would be eventually adopted by many governments around the globe in whole or in part. Analysts began applying CMM not only to IT operations and software development, but also in everything from risk through financial to innovation management. CMM soon led to a variety of *ad hoc*, derivative, hybrid, imitations or customizations by various governments, professional associations, vendors, researchers, and consulting firms, all based on capability maturity models.

The diffusion and modification of CMM seems similar to Xerox and photocopying. Xerox perfected photocopying technology and then dominated the market to such an extent that a Xerox became synonymous with a photocopy.

There are now hundreds of capacity maturity models around, but many, maybe most, are very different from CMU’s.

CMM has exploded in recent years as a quality improvement methodology. But there is much disagreement among practitioners, researchers, and theorists in the fields of IT, public management, and business over what works, what does not and why.

This entry looks at the variety of CMM government applications, asking: What is the basic methodology underlying CMM; how did other quality improvement initiatives generally and in government contribute to CMM’s development; what models currently compete in the CMM space; how are CMMs used in government; what problems, issues and controversies surround CMM as an approach and how can these be corrected; and what might constitute a future research agenda in the field?

BACKGROUND

The CMM Methodology

Most, if not all, CMM frameworks have the same basic methodology. This is how the CMU’s Software Engineering Institute’s CMM model works in the context of human resource management (P-CMM) (Curtis, Hefley, Miller, 2009).

The model’s purpose is to “help organizations characterize the maturity of their workforce practices, establish a program of continuous workforce development, set priorities for improvement

Figure 1. The five maturity levels of the P-CMM¹

Source: Curtis, Hefley, Miller (2009).

actions, integrate workforce development with process improvement, and establish a culture of excellence”(p.8).

The model “consists of five maturity levels, or evolutionary stages, through which an organization’s workforce practices and processes evolve. At each maturity level, a new system of practices is added to those implemented at earlier levels. Each overlay of practices raises the level of sophistication through which the organization develops its workforce.”

“Each maturity level consists of three to seven process areas, identifying a cluster of related practices that, when performed collectively, achieve a set of goals considered important for enhancing workforce capability. Each process area organizes a set of interrelated practices in a critical area of workforce management, such as staffing, compensation, or workgroup development” (p.45). Process areas are linked to specific measurable goals to be achieved for each maturity level.

The model is grounded in standard process improvement practices common to most high performing, successful organizations. The model is best-practices based. These serve as a reference model against which an organization’s process

improvements are benchmarked. “Workforce practices are standard organizational processes that can be improved continuously through the same methods that have been used to improve other business processes.” This is accomplished by means of a “standard appraisal method for process improvement” (SCAMPI) (p.9). The model is evidence-based.

The model incorporates common best practices, such as:

... competency modeling, 360° performance reviews, Web-enabled learning, knowledge management, team building, cool space, participatory decision making, incentive-based pay, mentoring, meeting management, and empowered work (p.26).

The Quality Improvement Movement

The “quality improvement movement” began after World War II with the work of Edwards Deming (“statistical quality control”) and Joseph Juran (“managing quality”). They sought to improve quality in basic manufacturing as a way to increase customer satisfaction. Total Quality Management (TQM), inspired by Deming and Juran, came into

its own in 1985, arising out of initiatives by the US Navy. TQM eventually was adopted across the federal government in the 1990s.

Now TQM generally refers to a wide variety of quality improvement models, frameworks or methods that are evidence-based, relying heavily on data gathering, sampling and statistical analysis, on the one hand, and management principles and best practices on the other, all in the context of continuous improvement.

Formed in 1946-7, International Standards Organization (ISO) (www.iso.org) is a membership organization of 163 country government standardization boards in fields ranging from risk management through health to climate change. Standards are based on consensus and are voluntary for compliance. One standard on quality management, ISO 9000, is widely used.

Six Sigma originated from a quality improvement initiative at Motorola Corporation, then General Electric in 1986. Six Sigma is

... a disciplined, data-driven approach and methodology for eliminating defects (driving toward six standard deviations away from the mean and the nearest specification limit) in any process – from manufacturing to transactional and from product to service (www.isixsigma.com).

The Baldrige Award for Performance (<http://www.nist.gov/baldrige/>), beginning in 1988, gave the quality improvement movement a boost by annually recognizing high-performing organizations in the US.

Another movement is Lean Thinking or Manufacturing, popularized by James Womack and Daniel Jones in the 1990s. Their work on the success of Toyota Motor Company revealed how the company reduced waste in manufacturing. The US Environmental Protection Agency frequently uses Lean in its quality improvement efforts (Lean Government Initiative, 2014).

The quality movement intersected with a “sister” movement in the public sector, “Reinventing Government.” David Osborne, in the 1980s,

sought to improve efficiency and effectiveness in government calling for it to be run more like a business. This eventually morphed into “The New Public Management” (NPM) in the 1990s, where it remains the dominant theory of public administration globally.

CMU’s Capability Maturity Model Evolution

Early efforts at quality improvement proved effective in basic manufacturing, but as IT became more prevalent, they proved less effective or relevant in achieving quality: enter CMM.

CMM originated in the seminal work on “stages of growth” conceptualized by Richard Nolan (1973). Nolan’s work in turn inspired Phillip Crosby’s (1979) “quality management maturity grid,” a tool similar to CMM. Watts Humphrey, the father of CMM, crystalized his thinking on CMM while an executive at IBM, and then at CMU’s Software Engineering Institute (SEI) in the early 1980s (Humphrey, 1989).

Unlike other frameworks, CMM is premised on the notion that organizations must pass through sequential stages of maturity (rather than seeking “continuous improvement”) before becoming fully capable. CMM defined and codified what it means to be “capable” in these different stages of maturity. CMM also developed metrics to assess progress.

In 1984, the US Department of Defense (DOD), recognizing CMM’s utility as a framework for software engineering, established SEI as a Federally Funded Research and Development Center (FFRDC) at CMU (www.sei.cmu.edu). DOD intended that SEI “address pervasive and significant problems that impede the ability of organizations to acquire, build, and evolve software-intensive systems predictably on time, within expected cost, and with expected functionality.” US government agencies commonly require a favorable CMM appraisal as a requisite for awarding contracts.

In 1991, the first edition of the CMM guidance was released. CMM is “based on actual industry

practices, reflects the best practices of the industry and reflects the needs of individuals performing software process improvement and process appraisals (measurement and benchmarking)” (www.sei.cmu.edu).

CMM soon spawned a variety of frameworks not only by SEI, but also by numerous others, including software development, procurement, network development, security, human resource (people), portfolio management, project management, and just about every aspect of management. (This entry uses “CMM” to survey the field. CMM, which is a registered trademark of SEI-CMU, has become a generic label for most capability maturity models.)

In 2002, CMM was expanded into a suite of products, Capability Maturity Model Integration (CMMI), including: product and service development, service establishment and management, and product and service acquisition. Interestingly, CMMI no longer mentions “software,” reflecting the extent to which it has become viewed as a more general management tool.

In 2010, SEI spun off its CMM activities into a separate entity, the CMMI Institute (www.cmmi-institute.com). The Institute now offers training, professional certifications, organizational assessments, and professional publications. DOD, having accomplished its goals for CMM, still employs SEI as a FFRDC.

Other Capability Maturity Models

CMU’s CMM directly or indirectly stimulated other organizations to include CMM in their frameworks. Depending on one’s definition, there are hundreds of CMM models (see <http://ibpi.org/standard/isoiec-15504/> for a catalog of websites). These are the most widely used.

ISACA is an independent, nonprofit specializing in information systems governance, security, audit and assurance (www.isaca.org). Developed in 2000, its signature framework is CoBit (Control Objectives for Information and Related Technol-

ogy) which addresses “strategic level and focused on high-level IT management processes.” ISACA reports that CoBit is not related to CMMI.

In 2008, the International Standards Organization (ISO) and the International Electro Technical Commission (IEC) (<http://www.iec.ch/>) released ISO/IEC 15504, as a follow-on to its 1993 standard SPICE: Software Process Improvement and Capability Determination. 15504 is not a true CMM but does include “a continuous representation in which organizational maturity is implicit in the processes.” 15504 is, however, a “metamodel that harmonizes several best practice frameworks.”

The IT Capability Maturity Framework (IT-CMF), developed in 2004 by the Innovation Value Institute (<https://ivi.nuim.ie/it-cmf/>), reduces complexity by systematically addressing IT organizational capability gaps, thereby leading to optimized value and innovation.” IT-CMF has been applied to public hospital management.

AXELOS in 2008 developed the Portfolio, Program, and Project Management Maturity Model (P3M3) which has subsequently been “mandated by the Australian government for use in projects – breaks down into seven perspectives: organizational governance, management control, benefits management, risk management, resource management, financial management and stakeholder management.” The UK also applied this model in a variety of agencies including the National Health Service.

AXELOS (www.axelos.com/itil) hosts the Information Technology Infrastructure Library (ITIL) which “use(s) IT as a tool to facilitate business change, transformation and growth” in: Service Strategy, Service Design, Service Transition, Service Operation, Continual Service Improvement (AXELOS, 2013).

Recently, Six Sigma has added a Six Sigma Maturity Model (SSMM) to its portfolio, one that quantifies the evolutionary stages organizations pass through as they implement Six Sigma (<http://www.isixsigma.com/>).

CMM in Government

CMM government applications are legion, and growing. A google search on “CMM government” yields 541,000 hits. Here are some illustrative applications.

The Government IT Space

Acquisitions is a perpetual problem—especially for large systems—in every phase of procurement: developing specifications, bidding, selecting vendors, monitoring vendor performance, controlling, managing investments, and changing requirements. US government IT mandates an array of CMM quality control tools (GAO, 2004, 2015a).

Enterprise architecture (EA), implemented in the 1980s, has lagged behind initial quality improvement expectations. The US employs a variety of CMM frameworks to improve EA adoption and effectiveness (GAO, 2010).

Open data—releasing agency data to the public—has become a global movement across governments. The Open Data Center Alliance publishes CMM standards for those public agencies wanting to improve the quality of data released to the public (ODCA, 2013).

Cloud computing, a way to reduce costs, improve performance, and promote quality, is becoming widely used in government. CISCO Systems developed a Cloud Capability Maturity Model (CCMM) for use by UK local and national governments.

Big data, business intelligence, and analytics offer government powerful new tools to gather, store, analyze and utilize the massive amount of data gathered. The Innovation Value Institute (2013) offers CMMs dedicated to information management; while Accenture offers governments CMM in business intelligence and analytics at the Centers for Disease Control, Federal Drug Administration, and Centers for Medicare and Medicaid Management.

The Green Grid, a consortium of industry and government, offers a Data Center Maturity Model

to help make data centers more efficient (www.thegreengrid.org).

Cyber security is perhaps the hottest issue facing government IT. In 2012, the Center for Strategic and International Studies recommended that US adopt a cybersecurity CMM government-wide (Reeder, et al., 2012). In 2013, the Rand Corporation conducted a cyber defense CMM analysis of the European Defense Agency.

E-government has transformed from a system exclusively intended to improve transactions to one where citizens interact with government through collaborative technologies and social media (Ibribarren, 2013). E-government CMM models are widely applied in government, Gartner’s Government Maturity Model is a popular one.

With the explosion of mobile technology in government, IBM developed the Enterprise Mobile Progressive Maturity Model to move away from “old fashioned” IT strategies to digital strategies.

The State of Oregon, adopted Gartner’s Maturity Model for Web Content, to help cities create state-of-the-art *websites*.

Tying these IT advances together is Forrester Consulting’s Technology Management Leadership Maturity Model. While KPMG employs an Information Technology Asset Management (ITAM) Capability Maturity Models to help federal agencies manage their technology assets.

The Government Non-IT Space

Non-IT CMMs are common in government in a variety of areas (NAO, 2010). Human capital management for IT workforces rely heavily on CMU’s People-CMM (Curtis, Hefley, Miller, 2009). The Balanced Scorecard methodology widely used in US government has been converted into a CMM and applied to strategic and performance management (BSI, 2015). Risk management is perhaps the most common of non-IT CMM applications used by government particularly in the finance area (Cienfuegos, 2013). New Zealand’s Office of Auditor General uses CMM in its process im-

provement program (OAG, 2012). The Australian Public Service Commission, in 2009, launched a National Innovation System—*Empowering Change*—mandating CMM models to encourage implementation and development. And the Malaysian Public Works Department employs its own CMM.

Some applications are rather surprising. The Canadian Human Rights Commission (<http://www.hrmm-mmdp.ca/eng/about-model>) developed The Human Rights Maturity Model to help employers create “a self-sustaining human rights culture in the workplace.” Lancaster University, UK, developed a Digital Forensics Comprehensive CMM (DF-C2M2) to help investigators raise the competency of their technical workforce.

City planning agencies often use CMMs. Digital Dublin (Ireland) developed the Digital City Maturity Model. The Scottish City Alliance utilizes a Smart City Maturity Model. The Transportation Research Board at the National Academies of Science makes available its Institutional CMM to US cities attempting to improve transportation operations. IBM markets its Intelligent Transportation Maturity Model to cities. And Deloitte Consultants conducted a maturity analysis, *Closing the Infrastructure Gap: The Role of Public Private Partnerships*, of governments around the world.

ARTICLE FOCUS

Major Issues, Controversies, Problems

The issues below apply more or less to all CMM models. There are hundreds of references assessing CMM (e.g., Morgan, 2007; Greiner, 2007; Betz, 2011; Van Wangenheim, 2010; Cienfuegos, 2013; McSweeney, 2013). Below is a distillation of the controversies and problems identified.

CMM Not Delivering on Promises

With IT and public management and policy failures—many guided by CMM approaches continuing to plague government—critics wonder whether these schemes are worth it (Ashkenas, 2013). The Government Accountability Office (GAO) maintains a “High Risk List” representing dysfunctional programs that threaten US government operations. Perpetually on that list are “government-wide IT” (GAO, 2015a), “Defense Department programs including acquisitions and operations,” and “strategic human capital management” (GAO, 2015b). Just for IT alone, the US government spends \$80 billion annually and still cannot get acquisitions and investment management right, even with the widespread use of CMM and other CIO tools. The US is not alone; most governments have similar problems. Australia recently reorganized its IT agency into two separate departments because of inefficiency and ineffectiveness, even though it employs the Portfolio, Program and Project Management Maturity Model (P3M3) to assure quality.

CMM Frameworks Lack Theoretical Underpinnings

CMM is grounded in expert opinion, peer review, best practices, benchmarking, learning trial and error, knowledge management, and performance assessments. It is not, however, based on scientifically validated theories of management. Proponents of CMM do not generally think this is an issue because the methods are self-correcting over time through careful assessment. Critics believe that CMM’s failings, when they occur, may be the result of a lack of theoretical rigor: CMM cannot demonstrate whether a particular improvement was the result of one of its principles or something else.

All CMM Frameworks Are Not Equally Credible

SEI-CMU and other products like ISO and Six Sigma are highly credible because they have rigorous methodologies, have been vetted by experts and have undergone extensive testing. Many other frameworks are lacking, but may appear to be credible because they exploit, whether intentionally or unintentionally, established CMM brands. This is a problem in government applications in that policy makers tend to borrow a lot from one another. Canada, UK, NZ and Australia all share frameworks, the “Capability Review,” for example. The Capability Review appears on the surface to be like CMM, but has nowhere near the rigor. The Australians, realizing this, have a “whole-of-government” approach that combines Capability Review and Capability Maturity (APSC, 2012).

CMM Assumes that Methods Apply to All Organizations Regardless of Function, Structure, Process and Context

CMM may not be universally applicable across organizations. Government organizations range wildly in terms of size, workforce unionization and characteristics, IT adoption, function, regulation, and so on. Is it possible that all government organizations would find the same CMM to be appropriate? On the surface, it seems not. Some government organizations are unconcerned with efficiency, effectiveness or quality. They focus, instead, on policy and political outcomes.

CMM Does Not Describe or Advocate Processes, It Offers Principles Good Processes Must Satisfy

CMM is a reference model against which organizations assess the capabilities of their processes. CMM does not advocate for specific processes,

neither does it describe them. This causes confusion in that organizations can know where they stand on the maturity level scale and where they need to be at full maturity, but may not know how to get there given the processes they have. This is problematic if processes do not support maturity levels: strategic alignment of missions, goals and strategies can easily come out of alignment when applying CMM.

Organizations Are Dynamic, While CMM Is Static

Organizations, even those in government, can be so dynamic that CMM may be unable to improve quality. CMM requires a stable, predictable, static organizational environment that can be fully (and perhaps laboriously documented). Take the US Department of Homeland Security (DHS), for example. In response to the terrorist attacks of September 11, 2001, the George W. Bush Administration created DHS by merging 22 disparate agencies, employing some 220,000 people. Each agency dragged along with it all of their legacy systems, nearly all of which lacked interoperability. Many were guided by CMM. Now in its fourteenth year, the reorganization continues and the system remains problematic. Proponents suggest that no quality improvement system could have addressed the DHS creation and subsequent reorganizations.

Further, Governments Do Not Have Years to Achieve Maturity Levels

Governments do not have the luxury of long time horizons in which to achieve some optimum level of capability maturity. CMM tends to be adopted in the public sector just after administrations change hands. Newly-elected or constituted governments typically throw out everything their predecessors have done and pursue their own initiatives.

CMM May Stifle Innovation, Rather Than Facilitate It

Critics raise the question, can organizations managed under CMM be truly innovative? Likely not. Phillips (2011) in *Relentless Innovation* convincingly argues that these systems are premised on the need for stability, predictability and risk avoidance. Hence, they have difficulty innovating. Time will tell whether innovation maturity models are able to overcome organizational barriers to innovation (Esterhuizen, Schutte, & du Toit, 2011).

CMM Maturity Levels Seem Subjective or Arbitrary

CMM separates itself from other frameworks by imposing change and improvements through maturity stages. Maturity stages seem somewhat arbitrary with respect to what is included in each level. It seems possible to swap items across the stages. Some suggest that stages are merely a rank ordering. It seems possible to skip through earlier stages fairly quickly. It's possible simply to "cherry pick" items from each stage and not go through the process. Advocates are adamant that the stages are meaningful and must be judiciously pursued.

In the End, CMM Is About Compliance

There is debate about what constitutes a best practice under CMM. CMM typically lists hundreds of practices and measurements that must be followed to attain maturity levels. Critics point out that these are really an exercise in compliance or "box ticking."

The Value Add of CMM to the Bottom Line Is Unclear

Critics ask whether the cost of undertaking CMM is worth it. The cost of conducting a CMM assessment is high for many organizations, especially small ones. But the cost of reengineering

an organization over a period of several years as it passes through various levels of maturity may be prohibitive. But is the cost worth the benefit? In many cases it may be impossible to determine whether a reengineered organization can even demonstrate that CMM made any contribution at all.

The Plethora of CMM Models Leads to Inefficiency and Confusion

The inventory of CMM frameworks is large. Some frameworks supplement or compliment others, but there are gaps. Audiences intended as beneficiaries are quite disparate. Organizations with many disparate needs may find that implementing different models can be problematic, not to mention inefficient. For example, ISO/IEC 15504 processes have no counterpart in CMML. Further, CMML focuses on maturity levels, while 15504 concerns "a continuous representation" of "implied" maturity stages.

SOLUTIONS AND RECOMMENDATIONS

There are a myriad of studies addressing issues above. But, like CMM itself, they are scattered all over the map, many not available on the Internet or even publicly available. What is required is a systematic program to address these issues.

Create an Organization to Catalog CMM

There are a few heroic ongoing efforts to catalog CMM applications, studies, and methods. The International Best Practice Institute, for example, provides a spreadsheet of websites for various models (<http://ibpi.org/about/frameworks/>). But there needs to be greater, more comprehensive effort in collecting a larger number of items for analysis.

In addition to collecting materials, there should be an effort to crosswalk or “map” competing models and frameworks to derive a picture of what is covered and what is omitted in each (e.g., Wendler, 2012). ISO/IEC 15504 does this to some extent. But much of the published work consists of comparisons of two or three methods (e.g., Doyle, 2009), not the entire collection of approaches.

Vet CMM Products

Catalogues and comparisons are a start, but these do little to establish credibility of the approaches. Just as *Consumer Reports* tests consumer products, there ought to be an organization to assess, vet and certify CMMs. The EU’s Open Source Observatory offers a possible model (<https://joinup.ec.europa.eu/community/osor/description>). European governments deposit open source software applications in a platform that allows participants to share software, content, studies, best practices and opinions.

Fund Scholars to Scientifically Study CMM’s Theoretical and Empirical Underpinnings

If there were not so many problems in managing IT organizations and others, it wouldn’t make much difference if CMM were grounded on expertise, benchmarking and assessments. But since there are problems, it might make sense to examine the underpinnings more systematically. Some believe that such an assessment might find hidden problems in CMM methods. Just as DOD originally set up SEI to develop CMM, a government organization (like the National Science Foundation, National Academy of Sciences, or the National Institute of Standards and Technology) or private foundation might facilitate scientific testing.

FUTURE RESEARCH DIRECTIONS

CMM represents a fruitful area of research not only for IT but also for public management. At present, CMM assessments and management studies are not scientific. Putting the two together affords an opportunity for both: CMM clearly spells out in great detail how to improve management and offers an empirical test bed for study; management studies have a lot of theory floating around, but limited opportunities for empirically testing: a perfect match.

CONCLUSION

Proliferation of quality improvement models and the problems associated with them should not lead one to conclude that CMM should be abandoned. What this means is that the field is maturing: there is more and more interest among researchers and practitioners. Competition is good. Furthermore, earlier efforts were effective, but perhaps limited. Now, CMM is being applied to nearly everything. CMM offers the best hope of advancing the quality improvement field. Now is the time to get serious about more carefully studying CMM as a discipline. Inevitably CMM will be replaced as the “science” of management advances, but that comes later.

KEY TERMS AND DEFINITIONS

Capability Maturity Model (CMM): A model that specifies various evolutionary or ma-

turity stages an organization must pass through in order to become increasingly capable in achieving efficiency, effectiveness and economy in its operations.

Maturity Stages: Clearly delineated stages that represent increasingly greater levels of competency or capability.

Model: An abstraction or representation which captures the essence of an organization, process, or operation to improve performance.

Practice: An activity, performance or exercise intended to become more proficient.

Process Improvement: Improving operations to increase efficiency, effectiveness and economy.

Reference Model: A model based on best practices and research that serves a comparator against which to evaluate a model under assessment.

Bridging Between Cyber Politics and Collective Dynamics of Social Movement

Kazuhiko Shibuya
ROIS, Japan

INTRODUCTION

This era of social media extends the bounds of traditional politics to ‘Cyber-Politics’ (Hill & Hughes, 1998; Jordan, 2001; Choucri, 2012). The advent of social media summons *the collective dynamics of democracy of the citizens, by the citizens, and for the citizens*. Such patterns using social media can readily alter the form of social movements, allowing their mutual interconnection and shaping the enclaves of networked clustering. Social media offer a new paradigm of democracy that encourages engagement and participation in both cyber and actual political actions for ordinary citizens.

Nevertheless, little is known about co-occurrence and linkages between cyber and real world actions by numerous participants. These are not limited to voluntary support for elections, donations, public discussion, and other collaborations, whether online or not. Especially, many observers have noted that ordinary citizens are apt to cope with social media as a bridge linking virtual and actual political activities.

Consequently, this issue should be investigated with open questions related to the following points.

1. **Social and Legal Background:** Social institutional matters related to legitimation crises caused by social movements
2. **Social Media and Its Relative Background:** Co-occurrence and Linkages of collective dynamics between cyber and actual political actions
3. **System Thinking and Simulation:** Enlargement of participants in social movement
4. **Beyond Borders:** Systemic Risks from Local to International Affairs

BACKGROUND

Certainly many reports have described that social media easily raise social movements or anti-autocratic revolutions by ordinary citizens. Those media have eagerly inspired ordinary citizens to participate in vigorous discussions as well as actual social movements (Casilli & Tubaro, 2012; Choudhary et al., 2012). It seems readily apparent that participants indeed have shared further motivations and common goals.

In Table 1, although the total population of participants could not be estimated accurately in each case, the entries exemplify serial movements: ‘Arab Spring’ (e.g. Jasmine and Egyptian revolutions), ‘Occupy Wall Street’ movement, the umbrella revolution in Hong Kong, and other recent events (e.g., a series of protests against the Charlie Hebdo shooting at France, and a series of protests against policy-making on the national security related bills in Japan and other nations). Those who participated expressed their desires for democratic institutions, freedom of public opinion, socioeconomic chances, and opposition against controversial political issues. They also made other demonstrative appeals.

Table 1. A part of recent movements

Events	Date	Nations	Estimated Max of Participants	Main Intention and Goal of Participants	Final Results
Jasmine Revolution	Dec. 17, 2010-Jan. 14, 2011	Tunisia	100,000?	Political Claims?	Revolution
Egyptian Revolution	Jan. 25, 2011-Feb.11, 2011	Egypt	2,000,000? (Tahrir square, Cairo)	Political Claims?	Revolution
'Occupy Wall Street'	Sep. 17, 2011	U.S.A.	15,000? (Foley Square, New York)	Socioeconomic claims and occupying area	Failure and Dissolution
The Umbrella Revolution	Sep.26,-Dec. 15, 2014	Hong Kong (China)	100,000? (Nearby the Admiralty)	Political Claims on Freedom for democracy and occupying area	Failure and Dissolution
Protests against the Charlie Hebdo shooting	Jan. 7, 2015	France	35,000? (Paris)	Protests for Public Opinion	Temporal Mass Meeting
Greece Economic Crisis 2015	Jun. -Aug. 2015	Greece	30,000? (Opposition Side, Atene)	Socioeconomic reasons	Temporal Mass Meeting
Opposition against the policy making on the national security related bills	Aug. 30, 2015	Japan	120,000? (Around the National Diet, Tokyo)	Political Claims and oppositions against controversial issues	Temporal Mass Meeting and oppositions
Catalan Nationalism for Independence	Sep. 11, 2015	Spain	1,000,000? (Català)	Political Claims for independence	Ongoing matter

Especially, the outcomes of the 'Arab Spring' became the trigger of similar actions. Furthermore, in Arab cases, each political regime was overturned by numerous participating citizens using social media. Subsequently, the results spurred regional and global strain (Boening, 2014; Sadiki, 2015). Democratic progress in Tunisia was awarded a Nobel Prize in Peace at 2015, but their activities require more efforts.

Sociologically, those phenomena might be categorized as social movements and expressions of the collective dynamics of behavior by numerous citizens (Le Bonn, 1931a, 1931b; Smelser, 1962). The movements realized social influence and catastrophic collapse of regimes caused by the crowds. Here, the categories of those actions by citizens include opinion expressions, group processes, identification, emotional attitudes, fads, mobs, criminal riots, demonstrations, and politically assertive agitations as well as social change against ancient regimes caused by large groups of citizens in uprisings and revolution (Olson, 1971; Brown, 2000; Rohlinger & Snow, 2003).

Legitimation Crisis Caused by Social Movement

A question arises: as exemplified by the case of 'Arab Spring', did those movements and revolutionary outcomes caused by mass popular movements have any legal background to subvert their government?

Principally, liberal democracy requires the freedom of expression for ordinary citizens and their deliberations in community (Mill, 2012). However, democracy has its own specific standards and procedures to deal with somewhat controversial policies (Johnson, 2008). Consequently, social scientists intensively regard all forms of collective action as problems of coordination and synchronization between stakeholders and actors of various types (Dogan, 1992; Klandermans & Roggeband, 2010). Democratic procedures can only legitimize fundamentals on ruling governance and sovereignty.

Certainly some theorists assert that people always retain the right to resist illegal policies

by the government (Rousseau, 2009). But such illegal policies signal a forfeiture of legitimacy in democracy. It is called a *legitimation crisis* (Habermas, 1976), and it denotes a breach of trust in national governance, institutions, and leaders. It sometimes causes danger of disrupting national governance.

Consequently, *legitimacy* is indeed an important fundamental in democratic society. Now again, the democracy and its legitimation fundamentals should be reconsidered. As its lexical meaning, legitimacy is ‘*in accordance with rules*’ in politics (Oxford English Dictionary). It is the nexus of political power, institutions, trust, and legal procedures including social justice and equality (Rawls, 1971; Nozick, 1974; Jost & Major, 2001; Fukuyama, 2014).

To date, and traditionally, legitimacy has been explored in many theoretical discussions. Originally, Aristotle, an extremely famous and historical ancient Greek philosopher, discussed theories of legitimacy based on the politics and ethics (e.g. *Politics*, *Nicomachean Ethics*). Today’s political democracy is strongly founded in these backgrounds and traditions.

As renowned philosophers, Rousseau (2009) critiqued the foundation of social contracts and constitution for the nation and citizens. And Locke (1988) argued the concept of liberal independence from natural law and slavery conditions in his famous representative works. He differentiated humans as three types: a nation, a citizen, and collective people. Their discussions clearly addressed citizens’ rights and obligations for governing national power.

However, the sociologist Weber (1958) categorized legitimacy as traditional, charismatic, or legal-rational. Then he broadened it for discussions of economic and politically legitimized powers, coercions, and dominance in the social relations and structure. Social power determines various social relationships, procedures, institutions, and the distribution of social capital (Lipset, 1959).

In addition, it is necessary to remain mindful of the acceptance of political regime by citizens (It equals with the concept on sovereign in democratic society). According to Anheier & Toepler (2010), “*the legitimacy was dealing with the relationship between the nature of acceptance of political regimes and their capacity to exercise power and authority*”. That is to say, it shall be consensually accepted by citizens, and it is grounded on democratic civil society. Democratic regimes are often approved by majority rule and consensual deliberations. It is necessary to assess legitimacy itself as well as democratic procedures (Ariely, 2015).

Regarding these concerns, Rousseau (2009) emphasized the general will of all citizens and the geometric balance between the governor, the sovereign, and citizens. He asserted that saving the ideal democracy requires that a tyrant be purged from public governance. Within a term of office, a governor is delegated to govern the nations by citizens as the general will in democratic society.

Generally, social movements and opinion assertions by collective actions of citizens against their governments in accord with rules are not considered to be beyond the grounds of democratic action. However, it seems that the final result of ‘uprising’ and ‘revolution’ caused by them could not be evaluated by the extrajudicial standard even though each has the right of resistance against tyranny of their government. When citizens face such conditions, social contracts as well as legitimacy in democratic meanings are often reconsidered.

Finally, to summarize, the concept of legitimacy in democracy consists of at least three factors. When these factors did not meet each standard, it might cause a legitimation crisis.

1. Legal-Rationality
2. Accordance with rules and social contract between the governor and a sovereign
3. Acceptance of political regimes by consensual sovereignty

Co-Occurrence and Linkages of Collective Dynamics Between Cyber and Democratic Movements

An important matter is to unveil the co-occurrence and linkages of the dynamics of mass participants in both cyber and political actions. That is the problem of intention, timing, and relations within social media usage and participation. *When and where do participatory citizens submit their opinions and collaborate with others using social media?* Differences between social media usages before participation, after participation or without social media in movements, and/or real-time social media usage in participation should all be noted.

These are certainly open questions posed for *computational social science* (Lazer et al., 2009). For example, they require understanding of social media usage patterns, structural organization patterns in human relations among leaders and followers, wireless clustered networking, geospatial mobility of collective participants using smartphones, population estimation and enlargement of participants in movements, and linkages between the results of public opinion and voting behavior.

What it observes online and offline were underlying not only in sentimental but somewhat organized responses by numerous citizens against governmental policies during the 'Arab Spring' (Choudhary et al., 2012). Alternatively, in the case of Hong Kong, participatory citizens had adopted wireless technologies (e.g. 'fire-chat' as a wireless communicable applications). Using those applications, they were able to construct ad hoc networking dynamically for social movements.

Then, researchers must consider the unconventional norms of cyber politics and demonstrations stemming from the influence of social media (Malinick et al., 2013; Agarwal et al., 2013; Rhue & Sundararajan, 2014; Bello & Rolfe, 2014; Golbeck & Hansen, 2014; Gonzalez-Bailon & Wang, 2016). Furthermore, as described above, it is now the era of social media and a ubiquitous computing society (Shibuya, 2004). Ordinary citizens can mutually collaborate easily using smart phones and mobile

devices. Attention should be devoted to their networked dynamics mechanisms. Consequently, researchers should unveil collective dynamics of cyber networking and actual behaviors in social movements for additional understanding.

Next, what are factors to engage citizens in both cyber and political actions? Even if citizens are able to use social media and ubiquitous services, they usually feel some trouble about participation. Namely it is too natural to think that vigorous discussion online has no direct reasons to activate and invoke citizens for actual efforts and revolutionary uprisings.

However, their activities often can easily produce bridges between cyber and offline differences (Bond et al., 2012). Some reasons why many ordinary citizens participate in those movements are considered to be social influence, opinion-group polarization and self-organization of networking such as opinion leaderships opinion-group polarization, and self-organization of networking such as opinion leaderships (Katz & Lazarsfeld, 1955; Huckfeldt et al., 2014), identification of group beliefs, peer-to-peer interactions, like-minded group formation and amplifications of motivations among members (Sunstein, 2001). Past reports have described that their mentalities are ruled under group minds (Le Bonn, 1931a, 1931b; Smelser, 1962; Rohlinger & Snow, 2003; Hedstrom & Bearman, 2009).

Many researchers have articulated that, using social media and internet communications, citizens have obtained tools for globally collaborating with like-minded partners at will (Aral et al., 2009). They can proactively choose information, web links, and communication partners. Computational algorithms can also be designed to offer personalized materials for each person. These systems learn from their web queries and records through collaborative filtering and machine learning. Moreover, each citizen can see and know only a part of the worlds. It is just stereotyped information contact for the actualities. As result, opinion-group polarization, group stereotyping, ideological expressions, are spreading information

of hateful opinions are now frequently observable (Sunstein, 2001; Bakshy et al., 2015).

Enlargement of Participants in Social Movement

Physicist Newton said “*I can calculate the motion of heavenly bodies but not the madness of people*”. As social constraints, it remains not to examine empirically dynamics on expansion of massive participants in social movement. But both empirical and simulation studies have been reported recently (Downs, 1957; Shibuya, 2004; Hedstrom&Bearman, 2009; Braha, 2012; Epstein, 2014). And some cases were identified as decentralized networking patterns without core agitating leaders (Castells, 2012; Malinick et al., 2013). According to interview studies conducted in the aftermath of the ‘Occupy Wall Street’ movement (Manilov, 2013), one participant reminisced “*What started as a couple of hundred people in a park with no plan has turned into a decentralized network of activities*”. Furthermore, it should

be exactly distinguished between onlookers and hard-core demonstrators whether social media usage or not (Bryan et al., 2014).

As one of the latter simulation studies, for example, the author presents an example of system modeling and its simulations on those movements and the legitimization crisis (Figure 1; Shibuya, 2016). Various elements and interactions as a system encompass the complexity of crises of legitimacy. Furthermore, it depicts hypothesized variables and cybernetic systems such as types of participants in movements (e.g., ordinary citizens, claimants, and hard core protesters), increasing total populations of participants, forming enclaves of participants, reinforcing a group entities and movements, and amplifying systemic risk of legitimization crises and disruptions of governmental systems. These factors can be reinforced recursively by other factors such as mobility dynamics of human behavior in spatial geometry (Rossi et al., 2015; Blondel et al., 2015), social media usage, and percolation criteria in networked clustering among participatory citizens.

Figure 1. System modeling on legitimization crisis caused by a series of social movements

Figure 1 depicts the progress of expansion by a self-reinforcing feedback loop in system modeling on a legitimization crisis caused by a series of social movements. Furthermore, it is similar to social phenomena such as *cyber-cascading* in politics (Sunstein, 2001), the spiral of silence (Noelle-Neumann, 1984), the band-wagon effect, political dynamics and networked clusters in social sciences.

As Sunstein has noted, these phenomena are caused by a ‘critical mass’ of people as participating citizens. Consequently, the need exists for quantitative means to estimate probabilistically the threshold of such a critical mass in advance. However, it is possible to estimate the criterion. Standing on percolation theory, a threshold of critical mass is strictly defined in the percolation principle (O’Sullivan&Perry, 2013). Furthermore, a percolation model is applicable to some of those social phenomena (Broadbent&Hammersley, 1957; Hoshen&Kopelman, 1976; Sahimi, 1994; Newman&Ziff, 2001; Newman&Park, 2003; Malarz&Galam, 2005). Sociologically, the critical mass of social movements is definable as a threshold model (MacCoun, 2012). Especially, empirical works have examined renowned theories and serial examinations proposed by Granovetter (1978). Recently, sociologically advanced investigations of collective dynamics in regular and random networks have been reexamined by cascading and percolation standpoints (Watts, 2002). He specifically examined random finite networks. Then he devoted some attention to systemic risk and cascading influences on fragile networking structures, designating it as a ‘Percolating vulnerable cluster’.

Systemic Risks from Local to International Affairs

In the ‘Arab Spring’, the results of citizens’ actions crossed unintentionally beyond international and geopolitical borders. They shed light on legitimization crises, conflict resolution (Deutsch & Coleman, 2000), and systemic risk in complexity

and network science (Helbing, 2013; Smith et al. 2014; Cranmer et al., 2015). That is because those risks raised further contagion and diffusion of disturbing factors beyond boundaries in the global networking era. The aftermath of ‘Arab Spring’ diffused around other nations and caused a domino cascade of national disruptions (Boening, 2014; Sadiki, 2015). After those movements and uprisings achieved their initial goals, and their ancient régime was reassigned to a renewed government in the name of citizens.

The new regime in Egypt has been struggling because no legitimate authority has been accepted by civilians since the ‘Arab Spring’. Furthermore, the direct and indirect results of revolutionary actions certainly caused severe damage against their daily life and common wealth.

Moreover, more severe international affairs related to masses of emigrants seeking asylum and refugees from Middle-East regions to the EU. Those populations, estimated as nearly half a million people (Migration policy centre, 2012), eagerly communicate with others using smart-phones and social media. Small exceptions made for them paved the ways to a rush into the door of EU. Calls for opposition demonstrations against immigrants’ policy were made in the EU member states, and antagonists described inequities and aggressions committed against them.

FUTURE RESEARCH DIRECTIONS

Social scientists explored appropriate methodologies to assess real-time dynamics of human behaviors. Their efforts can be improved by analyzing large amounts of data using social media and ubiquitous computational services (Shibuya, 2004). It is also regarded as big data for additional analysis in political studies (Golbeck & Hansen, 2014). As noted earlier, this research style is realized as *computational social science* (Lazer et al., 2009). It has been applied by computational advancements such as visualization, data mining, text mining, network analysis, sentiment analysis,

modeling, and simulations. Furthermore, geospatial information systems (GIS) can be appended to the list above. These backgrounds have been examining collective behavior patterns of ordinary citizens using mobile devices (Gonzalez, Hidalgo & Barabasi, 2008; Hedstrom & Bearman, 2009; Newman, 2010; Bond et al., 2012; Evangelopoulos & Visnescu, 2012; Doer, Fouz & Friedrich, 2012; Agarwal et al., 2013). Therefore, it is not surprising that many researchers will be striving to elucidate these mechanisms.

CONCLUSION

The author argued that the advent of social media summoned *the collective dynamics of democracy of the citizens, by the citizens, and for the citizens*. Those patterns readily transformed the form of social movements to mutual interconnection and shaping of the enclaves of networked clustering. Social media have offered a new paradigm of democracy such as engagement and participation for ordinary citizens.

As Fukuyama (1992) forecasted “Is history directional, and is there reason to think that there will be a universal evolution in the direction of liberal democracy?”, the ‘Arab Spring’ and similar events have been repeated ever since civilizations have existed. Furthermore, is the utilitarian’s slogan “The greatest happiness of the greatest number” always correct in democracy? Then stakeholders must tackle unavoidable questions at each occasion. They should choose solutions through deliberative and collaborative activities.

KEY TERMS AND DEFINITIONS

Acceptance of Political Regimes by Consensual Sovereignty: It shall be consensually accepted by citizens, and it is grounded on democratic civil society (Anheier & Toepler, 2010). Citizen equals with the concept on sovereign in democratic society.

Accordance with Rules and Social Contract between the Governor and a Sovereign: These are a lexical definition (Oxford English Dictionary) and social theories (e.g. Rousseau and others).

Cyber Politics: Political actions online have flourished since the advent of social media. Using big-data accumulated in Twitter and SNS,

real-time dynamics of users' opinion and their political attitudes have been unveiled.

Legal-Rationality: Sociologist Weber (1958) categorized legitimacy as three types such as traditional, charismatic and legal-rational.

Legitimacy: In political definitions, the concept of legitimacy in democracy consists of at least three factors.

Legitimation Crisis: It means the forfeiture of legitimacy in society (Habermas, 1976), and it denotes a breach of trust in national governance.

Percolation: Percolation can be observed widely as various diffusion and self-organized clustering patterns in a geometric field. Percolation was explored in mathematics, statistical physics and chemistry, computational complexity sciences and social sciences (Broadbent & Hammersley, 1957; Hoshen & Kopelman, 1976; Sahimi, 1994; Newman & Ziff, 2001; Newman & Park, 2003; Malarz & Galam, 2005; O'Sullivan & Perry, 2013). Percolation in clustered networks can be categorized to two types as sites (spatial adjacent nodes are occupied or not) and bonds (interconnected edges or not). In addition, each network pattern has its own specific critical point (threshold) for phase transitions, which indicates the borderline between clustered organization and disruption of networks in a spatiotemporal field.

Community Broadband Networks and the Opportunity for E-Government Services

G

Idongesit Williams

Aalborg University, Denmark

INTRODUCTION

This paper discusses how communities in underserved areas in developed and developing countries can develop Broadband connectivity in order to access e-government services. Community Based Broadband Mobilization (CBNM) models developed by Williams (2015) are used as explanatory tools for the discussion. In this article, a community refers to a social unit bound by a common purpose or characteristics. Communities include villages, suburban areas, academic groups, professional organizations, neighborhoods, non-profit organizations, etc., In this article, the context of “the community” is rural areas. Communities have developed fixed and wireless Broadband networks in developed and developing countries (see (Salemink & Bosworth, 2014; Williams, 2015)).

They do so by forming Community Broadband Networks (CBN). The CBNs are communities that facilitate the development of Broadband networks in their communities.

The existence of CBNs presents an opportunity for facilitating Broadband connectivity in underserved (rural) areas. It also provides the opportunity to facilitate e-government services in underserved areas. This is because, the existence of Broadband network connectivity presents the possibility for the delivery of the e-government services in such areas (Zambrano & Seward, 2013). Hence, CBNs provided the boost for the implementation of e-government infrastructure and services in rural areas in many countries. They aid in reducing e-government network infrastructure deficiency in many countries. This deficiency exists (ITU, 2015; Zambrano & Seward, 2013;

*Figure 1. Percentage of households with internet access
ITU, 2015.*

DOI: 10.4018/978-1-5225-2255-3.ch308

Wachira & Arlikatti, 2010; UN, 2014). The ITU version of the Internet Infrastructure deficiency is represented in the figure below. Countries in developing countries suffer more from the infrastructure deficiency than those in the developed countries.

However, it is not every community that has the desire to facilitate CBNs. Residents of rural communities are inundated with competing economic and social needs. These needs eclipse their desire to facilitate Broadband infrastructure. The question now is, how can the public sector mobilize communities to facilitate Broadband infrastructure for the purpose of e-government service delivery?

To answer this question, this article adopts the CBNM models by Williams (2015). These models explain why communities facilitate CBNs. It presents an idea of the conducive conditions that should exist before communities in developed and developing countries can facilitate CBNs. In both models, the priority is placed on the level of usefulness of the service to the community. If the proposed service has the potential to enhance an important aspect of their lives, then - for them - it is a service worth having. Based on the premise of these models, this article explains that e-government services are services worth having access to. Hence, if people in communities are made to understand their need for e-government services, the desire to facilitate a cost effective Broadband service will be prompted among them. These explanations are accompanied by simulated examples.

Based on this exercise, this article reveals that CBNs are important but ignored players in the facilitation of e-government infrastructure and service delivery. Hence, efforts should be made to see how CBNs can be incorporated to deliver network infrastructure needed for e-government services, to underserved areas. In the upcoming sections, the concept of e-government will be discussed. Here the connectivity problem will be highlighted. This will be followed by a discussion on the concept of CBNs. A link will be created

between two concepts using the CBNM model by hypothetically simulating the relationship between e-government services and CBN.

BACKGROUND

In this section, the concept of e-Government and how the connectivity factors impede e-Government service delivery will be discussed. The major themes in this section are: what is E-government and why it is necessary? How is e-government facilitated and what is the connectivity problem?

What Is E-Government and Why Is It Necessary?

E-government is the delivery of government services to citizens via the Internet (Kettani & Moulin, 2014). National governments globally are keen on facilitating an information society via e-government (UN, 2014). The primary beneficiaries of the information society are citizens and businesses. E-government enhances Government-Citizen and Government-Business relationships. The success of these relationships is hinged on “efficiency” and “trust” resulting from the level of transparency in the delivery of government services. The quest to achieve efficiency and transparency in the delivery of government service makes e-government necessary.

Previously transparency, in the delivery of government services, was enhanced by the use of old media. Such media platforms included television, radio, newspapers, notice boards at government offices and local community information outposts. The disadvantage of the old media platforms was the difficulty in creating efficient accessible archives to citizens. Retrieving vital data from the archives was a challenge. The advent of the mainframe computer, minicomputer and later Personal Computers (PCs) in the 20th century provided an efficient way of archiving information for government agencies (Campbell-Kelly & Aspray, 1996; Norris & Kraemer, 1996). This

was the bridge between the old media platform and new media platform. Government agencies gradually transferred relevant archived data needed for Government-citizen and Government - Business interaction into the computers. But computers, then, were only used for interactions between Government - Employee and Government-Government relationships. In this scenario, the supporting technologies were Local Area Networks, telephones, fax and telegraph services (Norris & Kraemer, 1996). Citizens and businesses had to rely on old media (radio and TV), telephones, fax and telegraph services in dealing with governments.

However, the efficient delivery of government services was impeded by bureaucracy (Ho, 2002). Citizens and businesses battled with the command structure of the government agency to get things done. The processes involved in the delivery of public services, such as procurement, required some level of scrutiny. This entailed the creation of various oversight positions for government personnel. This was necessary to ensure value for money for the public sector in the procurement process. However, bureaucracy resulted in high transaction costs for the public sector and for the citizens and businesses as well.

Today, technological advancements provides the opportunity for the public sector to deliver their services in an efficient way and in a more transparent manner. The interactive features of new media has enhanced transparency in the governance process (Calista & Melitski, 2007). New media platforms are enabled via the technological convergence of the Broadcast, telecommunications and electronic communication platforms (Williams & Falch, 2012). This convergence is facilitated via Broadband networks (Calista & Melitski, 2007).

This technological evolution has minimized bureaucracy. Fewer staffs are now needed by government agencies. Soft copies of relevant information stored on PCs earlier be accessed electronically by citizens and businesses today. The citizen and business owners do not necessarily have to visit the government agency. Rather, they have remote access to Government services at their convenience. Hence the move towards efficiency and more transparency in government service delivery via e-government platforms is assured.

How Is E-Government Facilitated?

E-government facilitation can be identified in four levels. These include, the Service infrastructure,

Figure 2. The four levels of e-government facilitation to the citizen Williams, 2016.

Network infrastructure level, the institutional infrastructure and the application level.

As seen in Figure 2, the upper layers rely on the existence of the lower layer. The emphasis of this article is on the network infrastructure level. The argument is, if this infrastructure exists in underserved communities, then people in such communities will have access to the services provided at the application level. However, a brief overview of the other levels are as follows:

1. **The Institutional Infrastructure:** They coordinate the network infrastructure, the service infrastructure and the applications needed to facilitate e-government implementation. The institutional infrastructure includes the existence of regulatory bodies with the requisite legal mandate to coordinate the implementation of e-government in a given country or region (Zambrano & Seward, 2013). Internationally, UN agencies promote e-government implementation (See (UN, 2014)). They partner with national e-government agencies and International Development Partners to facilitate national e-government ecosystem.
2. **The Network Infrastructure:** This is the telecommunication or Internet

Infrastructure, transporting the e-government services to and from the end user (See (Zambrano & Seward, 2013)). Broadband is the preferred communications technology by Governments today. This can be seen in the case of Sweden, Denmark, Germany and South Korea, etc (OECD, 2008). Broadband is adopted because of the enhanced data rates, capacity and Quality of Service it provides.

3. **The Service Infrastructure Includes:** These consist of infrastructure elements used by the Government agency(ies) to support the delivery of the e-government applications. These include software, hardware, data center, personnel and requisite policies mandating the specific government service to deliver the service. The service infrastructure may be a coordinated service infrastructure or a service infrastructure developed in silos.
4. **The Application Level:** This is the layer where e-government applications are accessed by the citizens, governments, businesses and employees (Chairunisa, Malik, & Rahman, 2016).

In each of these levels, there are the demand and supply actors that aid the e-government facilitation process. This reflects in Table 1.

Table 1. Supply and demand actors in each layer of e-government implementation

	Supply Actors	Demand Actors
Institutional infrastructure	• National agencies mandated to facilitate e-government services in the country • *The law making entities	• Citizens • Businesses • Employees • Government
Network infrastructure	• Broadband Network infrastructure manufacturers • The e-government infrastructure operator • The law making entities, • Commercial Broadband Network operators	• Citizens • Businesses • Employees • Government
Service Infrastructure	• The software and hardware vendors, • The supplier of connectivity	Sectoral government agencies
Application level	Sectoral government agencies	• Citizens • Businesses • Employees

Williams, 2016.

*These law making entities are the legislative bodies that provide the regulatory framework for the facilitation of e-government initiatives in a country.

However, at the network infrastructure level, which is of interest to article, CBNs currently are not recognized by e-government implementation agencies. This is because communities are seen as consumers. Studies indicate that the e-government network infrastructure is often provided by commercial operators. The commercial operator in many cases operates under a Public Private Partnership (PPP) agreement (UN, 2014). But can communities really help? Before discussing this question, the next subsection explains why there is a connectivity problem.

Why Is There a Connectivity Problem?

The connectivity problem as mentioned earlier in this article was linked to the existence of Broadband Access gaps in different countries. This is a supply-side problem at the network infrastructure level. The Universal Access of Broadband connectivity in any region or country presents the opportunity for Government institutions to deliver their services online. This is why, network connectivity is seen as a fundamental problem. Hence the argument, is, if CBNs can solve this problem, why not facilitate them? Arguments for the facilitating these networks will be explained in the next section.

SOLUTIONS AND RECOMMENDATIONS

In this section the concept of CBNs and the CBNM models are discussed. The themes in this section are: What are CBNs? And why does CBNs exist? This question introduces the CBNM models.

What Are Community Broadband Networks?

CBNs are Broadband Network facilitated by a community. Their area of operations could be a neighborhood in a city or a rural area. These

networks are mostly wireless networks. However, in recent times, communities have embarked on facilitating expensive high capacity networks (Salemink & Bosworth, 2014; Williams, 2015). Community networks have been in existence since the early part of the 20th century. Fixed-line telephony infrastructure in rural areas have been facilitated by local cooperatives mostly in developed countries (Finkelievich & Kisilevsky, 2005). This tradition still continues today with the facilitation of Broadband infrastructure (see (Salemink & Bosworth, 2014)). This is evident in communities and neighborhoods in the global north and south respectively. Some affluent communities in the global north have facilitated expensive networks such as Fiber to the home. This can be seen in Sweden and in the Netherlands (Lindskog & Johansson, 2005). However, in less affluent communities in the global north and south, Wi-Fi over fiber connectivity is used to deliver Broadband connectivity. Examples can be found in the United States, Argentina, India, South Africa, Philippines, Canada, and in Europe (Williams, 2015). In some cases, these communities facilitate the network either with the aid of public financing, joint public ownership or in most cases self-effort (Kakekaspan, O'Donnell, Beaton, Walmark, & Gibson, 2014). The advantage of CBNs is the fact that they facilitate Broadband networks in areas where commercial operators shy away from (Williams, 2015). They manage these networks by forming cooperatives governed by democratic values.

Why Do Community Broadband Networks Exist?

This question is answered in a study conducted by Williams (2015). The study was conducted to understand the ways these networks can be financed and organized in rural areas in developed and developing countries. As part of the study, there were investigations in to why rural communities in developed and developing countries facilitate these networks (Williams, 2015). He studied three

Figure 3. Community Broadband Network Mobilization (CBNM) model for the developed countries
Source: Williams, 2015.

cases each in developed and developing countries. The developed countries were namely, USA, Sweden and Denmark. The developing countries were namely, Ghana, South Africa and India. That aspect of the research produced, 2 models named the Community Based Network Mobilization Models (CBNM). These models indicated that, if the causal factors of the CBNM models exist or are promoted, rural communities in developed and developing countries will facilitate Broadband networks in their areas.

The first model was the CBNM model for the developed countries. This is seen in the figure below.

The first model explains thus: If the citizens of communities in rural areas of a developed country can perceive the usefulness of a technology, the deployment possibilities and they possess the vital resources needed to facilitate the technol-

ogy, they will mobilize themselves and deploy the technology. The findings of the study suggest that, people in rural areas in the developed countries already had an idea of services, the technology can deliver. This was because, they were already using the services. Hence they already knew the usefulness of the service. What they cared about was, how they could have access to a better Quality of Service at a cost they could afford. The vital resources concept in the study implied any resource needed to facilitate the network. These could be intrinsic resources such as technical knowledge, innovative thinking to extrinsic resources such as financial resources, human resources (mostly volunteers), technical resources, such as technical equipment etc..

The second model was the CBNM model for developing countries. This is seen in the figure below.

Figure 4. Community Broadband Network Mobilization (CBNM) model for developing countries
Source: Williams, 2015

The second model explains thus: If the citizens of communities in rural areas of developing countries can perceive the usefulness of the service, the usefulness of a technology, the place of the technology in their daily lives (accepted user need) and they possess the vital resources to facilitate the technology, they will mobilize themselves and deploy the technology.

Based on the study, it was realized that the citizens of developed countries were better off financially than their counterparts in developing countries. The citizens in the developed country were conversant with the value of the service to their lives. Hence, when they realized that they could facilitate the technology that will deliver the service, they went for it.

However, in developing countries, many had no idea about Broadband services. Hence, they needed demonstrations to enable them see the usefulness of the service. But seeing the usefulness of the service was not enough. They had other competing needs in their lives. Hence the demonstrations had to prove that using the Broadband service was a better substitute to their existing solutions. Williams (2015) mentioned VoIP as a cheaper substitute to voice telephony and YouTube as a better entertainment substitute to the limited channels provided by the local television stations. The study further revealed that this insight into substitute possibilities did aid the would-be user see the usefulness of the technology. Hence, if they have the vital resources, they will facilitate the network. The vital resources concept is similar to that of the developed country cases. However, as seen in the CBNM model for developing countries, the lack of financial resources led the initiators to use the demonstration as a way of mobilizing users to deploy the network. Once the population achieved critical mass needed to raise an economy, they formed organizations and deployed on a broad scale. That is why the loop exists in the framework.

HYPOTHETICAL RELATIONSHIP BETWEEN E-GOVIRONMENT SERVICES AND COMMUNITY BROADBAND NETWORKS

Having explained, the concept of CBN and introduce the CBNM models, how can community networks aid in facilitating e-government, hence extending connectivity? In this section e-government service inspirations that could trigger communities to adopt these models are explored. The examples here are hypothetical.

1. Hypothetical Relationship From the Developed Country Perspective:

- a. **Service Inspiration:** In Denmark and Sweden citizens can submit their tax returns online (Williams, Kwofie, & Sidii, 2016). In Germany, citizens have access to an online “tax calculator”. Here citizens can have an idea of their tax rates (Steuer, 2016). In Estonia and Switzerland, voters participate in election via online voting from the comfort of their homes (Evoting Estonia, 2016; Evoting Switzerland, 2016). In some states in the United States, such as Texas and Colorado, people can renew their drivers license online (TDPS, 2016). These are examples of government services provided online in some developed countries. In most developed countries, municipalities also have various services by which they provide online (OECD, 2008).
- b. **Perceived Usefulness of the Technology to the Services:** The examples cited above are services needed by those living in commercially viable areas as well as non-commercially viable areas. No one wants to pay more tax than he or she is supposed to. No one enjoys queuing all day or

having to drive to a polling station to vote. Also, having your drivers license delivered to your mailbox is of great convenience. If these services are to be accessed by the citizens and businesses, then there is a need for access to a high capacity Internet or telecommunications network in their premises. Hence, Broadband networks delivering at least 256 kbps to the citizen are of importance. Therefore, these needs can serve as a trigger that can facilitate the CBNM model. This is an example of the “perceived usefulness” for a the technology (Broadband) for accessing e-government services.

- c. **Deployment Possibilities:** As explained by Williams (2015), the deployment possibilities consist of gateway possibilities to the community, the access connectivity to the homes and the ability to facilitate the technology technically and economically. The study explains that the communities, driven by the need for the service, conducted a search for deployment possibilities. In facilitating CBN aimed at facilitating the delivery of the above mentioned e-government services to its resident, there are technical deployment possibilities.

- i. **Community Gateway**

Connectivity Possibilities: In a lot of developed countries, there are different Fixed and Wireless Broadband gateway possibilities. The fixed gateway possibilities include fiber optics and ADSL networks passing close to the communities (Williams, 2015). This is because central and middle level governments (municipalities inclusive) in the United States and in the EU have invested in the development of

National Broadband backhaul projects (Feijoo, Gomez-Barroso, & Bohlin, 2011). Most of these infrastructures are in close proximity to rural areas and underserved areas. The second possibility is the rapid deployment of 3G and 4G wireless Networks by Mobile network operators in western cities with close proximity to the community (Williams, 2015). Hence, gateway connectivity can be achieved via a wired or wireless link, depending on the economic ability of the community.

- ii. **Community Access**

Connectivity Possibilities: A low cost Wireless Local Area Network, such as Wi-Fi can be deployed as an access network to the homes in the community. Recently, Wi-Fi standards have improved. In 2014, the 802.11ac (so called 5G WiFi) was developed. It can provide a throughput of up to 6Ghz (Aboul-Magd, Kim, Wentink, Yang, & Stacey, 2013). The Wi-Fi spectrum in most countries operating in the 2.4GHz to 5MHz frequency band is unlicensed. As seen in the study by Williams (2015), it was interesting to note that the cost of deploying Wi-Fi can be reduced, by the fabrication of antennas and the use of rooftops as base stations for the antennas. Hence there is the possibility of deploying such networks in developed countries to aid the extension of e- government services.

- d. **Vital Resources:** The vital resources here in the developed country context will include, financial resources of the individual members of the community,

financial resources they can harness from outside, human resources (technical and non-technical volunteers), non-technical resources, technical resources and self-will. Williams (2015) explains that self-determination was critical to the communities as they had to overcome regulatory odds, technical odds, and financial odds to fulfil their dreams. Examples of non-technical resources include, the use of hills, houses and elevated plane as natural base stations. There could be other non-technical resources needed depending on the technology to be deployed by the community and the terrain of the community.

This example indicates how the CBNM model for the developed countries can be used to deploy hypothetical e-government solutions by CBNs in the developed countries. The important factor here that the e-government service serves as a driver.

2. Hypothetical Relationship From the Developed Country Perspective:

- a. **Services Inspiration:** In some developing countries, there is the possibility of facilitating public health, election and local market-management online. Though few of such initiatives exist, the supply of e-government services is still limited (UN, 2014).
- b. **Usefulness of the Service:** The services mentioned are useful. This is because, the market is where food to nourish the body is bought. Without the market, most people without farms will starve. The health center is where ailments are treated. If they do not exist, the mortality rate will be high. People in developing countries care about whom they elect as leaders. Election turnout in most developing countries is high (Pintor, Gratschew, & Sullivan, 2002).
- c. **Usefulness of the Technology:** The technology solution needed to deliver health, election and market management as e-government services, is similar to that of the developed country. Williams (2015) recommends a Wi-Fi network over 3G or 4G connectivity for CBNs in developing countries. Wi-Fi is recommended because it provides Broadband connectivity and the antenna parts can be fabricated by the people. Broadband will provide a better Quality of Service delivery for the services. Hence, it makes the technology useful. However, the people may not abandon competing daily needs to facilitate the network, by just knowing the usefulness the technology.
- d. **Accepted User Need:** A small network created for a single case such as e voting, e health or market management. The Williams (2015) study, explains that such an initiative will lead people to try the service for themselves. In this manner, they could see the convenience in service delivery and will whet their appetite for the service. However, it is the existence of the vital resources that leads the community to attempt implementation.
- e. **Vital Resources:** This concept is same as that of the developed countries. However, here, Williams (2015) explains that retirees, educated youths that could not succeed in the city and urban-rural migrants are great non-technical human resources. This is because they can learn about the technology and teach the others why the service is useful and how they can facilitate it. In rural areas in developing countries, there are scrap yards. In these yards lay materials that can be recycled by the locals and used as antennas. There are many other vital resources that would exist. This will vary from country to country.

This example indicates how the CBNM model for the developing countries can be used to deploy hypothetical e-government solutions by CBNs in the developed countries. The important factor here again is that the e-government service serves as a driver.

FUTURE RESEARCH DIRECTIONS

Research into CBNs centers on how communities develop and use ICT Infrastructure. ICT infrastructure and service delivery via CBNs has been investigated in sociology and Information Science respectively.

(Carrol & Rosson, 2007). The CBNM models serves as analytical frameworks for researchers in both fields. The model will aid researchers investigate the facilitation and delivery of an ICT services in a particular location.

CONCLUSION

CBNM models adopted by the CBNs in the Williams (2015) study have the potential to facilitate Broadband infrastructure to aid the delivery of e-government services. However, an enabling environment is needed to facilitate the CBNs. The factors that would create an enabling environment includes:

1. **The Identification of User Needs:** The e-government implementation agency has to identify the e-government services that people in such communities cannot do without.
2. **Awareness Creation:** There are communities whose residents may not ignorant of the usefulness of the e-government services to them. Capacity building initiatives will be relevant here. Such initiatives will create the awareness of the usefulness of the e-

government services to the community. They will identify their need for the services. This will lead to the desire to have access to the service.

3. **The Removal of Regulatory Barriers:** The Williams (2015) study proposes the removal of regulatory barriers for CBNs. This is possible if national e-government implementing agencies, recognize CBN as partners in the e-infrastructure delivery process. CBNs hold the key towards enhancing access connectivity to their locality. The fact that such communities have the potential to facilitate broadband connectivity, should be an encouragement via requisite policies.
4. **Public Policies Aimed at Sustaining CBNs:** The sustenance of CBNs should be of concern to policy makers. Some initiatives to ensure sustainability includes:
 - a. **Regulating the Cost of Interconnecting the Community Networks to the Gateway:** This can be done either via the public subsidization of the cost of interconnecting to the gateway for the CBNs. This will reduce the monthly or yearly operational cost of running the network.
 - b. **Public Financial Incentives:** This could be subsidies, loans or grants. This will subsidize the CBN's capital expenditure greatly.

In conclusion, this article does not imply that CBNs are either the best or only way by which Broadband connectivity can be extended to rural areas. Rather, this article implies that, since communities have the ability to facilitate such networks, then it is important to recognize them by developing e-government services that is of use to them. If this is done, and the communities are made to see that they can facilitate the network to serve the need. They will do so.

KEY TERMS AND DEFINITIONS

Broadband: A telecom network whose data rate is at least 256kbps.

Community Broadband Networks: A community that facilitates Broadband networks.

Community: A social unit bound by a common purpose or characteristics.

Convergence: The delivery of telecoms and broadcast services on one service platform.

E-Applications: Web applications providing access to e-government services.

E-Government: The delivery of government services to citizens via the Internet.

E-Services: Government services delivered online.

New Media: The delivery of broadcast and interactive media platforms over the Internet.

Critical Success Factors in E-Democracy Implementation

Aderonke A. Oni

Adekunle O. Okunoye
Xavier University, USA

INTRODUCTION

The use of Information and Communication Technology (ICT) in enhancing citizens' political participation has been identified as a solution to the problems of representative democracy, particularly, the disconnection between representatives and citizens and the decline of political interest amongst the populace (OECD, 2003b; Polat, 2005; Backhouse, 2007; Kang and Dugdale, 2010). One of the key issues in e-democracy development is to acquire an e-democracy system that considerably meet the needs of the citizens to participate in the democratic process and the government's needs to provide citizens with adequate participation channels (Funikul and Chutimaskul, 2009).

A successful e-democracy implementation should target developing a system that will meet the government's needs and provide citizens with adequate participation channels. There have been several cases of e-participation projects initiated by different actors around the world but the issue of sustainability and citizens acceptance for online public participation remains a difficult task (Panagiotopoulos and Al-Debei 2012; Saebo et al., 2008). As noted by Wouters (2008), examples of good practice are extremely rare in e-democracy implementation. Most e-democracy implementation has experienced mixed success (Coleman and Norris 2005; Blackhouse 2007), some have failed to meet up with the demand of the dedicated advocates (Oni et al., 2014) while some are battling with lot of replication of efforts

within countries driving full fledged e-participation across their governmental bodies. Several scholars have also worked on having a lasting e-democracy implementation, some notable efforts are found in Black and Noble (2001), Clift (2004), Local E-Democracy National Project (2006), Funikul and Chutimaskul (2009) and e-democracy project planning route map. Ensuring success in e-democracy implementation requires harmonizing the technological, economical, political, legal, cultural issues pertaining to e-democracy. As noted by Kotsiopoulos (2009) barriers to greater online citizen engagement in policy-making are not technological but cultural, organisational and constitutional.

This article will provide an in-depth description of key issues to consider in making participatory e-democracy user-friendly, effective and deliver the expected outcomes. Important issues pertinent to the success of e-democracy project were explored. These are technological, social and political issues that make for good success in e-democracy implementation. These are beyond the traditional concerns of the digital divide.

BACKGROUND

Democracy is a system of government in which the power is vested on the people and the will of the qualified majority rules. Chi-Ha (1977) further describes democracy as an ideology opposed to silence, a system that respects a free logos and

freedom of speech and encourages the cacophony of dissent. Combining the words “Electronic” and “Democracy” according to Caldow (2004) means the use of ICT tools to facilitate, improve and extend democratic activities. Cliff (2000), e-democracy is considered as the use of information and communication technologies and strategies by democratic actors (governments, elected officials, the media, political organizations, citizen/voters) within political and governance processes of local communities, nations and on the international stage. E-democracy is, therefore, anything that governments do to facilitate greater participation in government and enhance effective governance using digital or electronic means (Colman and Norris, 2005). Hye, Jong and Hae (2008) gave a more explicit definition as they defined e-democracy as the use of cyberspace and mobile technologies to enhance effective governance. Macintosh (2004) referred to e-democracy as the use of information and communication technologies to engage citizens, support the democratic decision-making processes and to strengthen representative democracy. From these definitions, three major elements of e-democracy can be identified which are people, technology and political process or culture.

The people are the democratic actors including governments, elected officials, the media, political organizations, citizen, civil society groups, etc. Technology includes the various ICT infrastructure and e-participation tools used to facility online political participation such as e-consultation, e-petition, e-panels, etc. Political culture is the distinguishing beliefs, values, attitude, habits, and behavioural patterns that characterized a political community. It is the common perception of the right and obligations of citizens and rules for participating in political process.

According to Caldow (2004), e-democracy has two sides: the tactical side and the strategic side. The tactical side deals with the use of information technology to advance communication and promote access to information while the strategic side considers how government can use digital media to actively engage citizens and advance

its public policies to the global community. This includes the use of e-democracy initiatives to engage citizens in democratic processes such as policy deliberation, information enquiry, petition against corrupt practice, and expression of opinions through forums (Coleman and Gotze, 2001; Funikul and Chutimaskul, 2009).

One of the key issues in e-democracy development is to acquire an e-democracy system that considerably meet the needs of the citizens to participate in the democratic process and the government's needs to provide citizens with adequate participation channels (Funikul and Chutimaskul, 2009). A successful e-democracy implementation should target developing a system that will meet the government's needs and provide citizens with adequate participation channels. The key characteristics of e-democracy are better service with the appropriate access time, reasonable cost of utilizing suitable ICT, responsiveness of government in listening, and support of citizens' participation (Funilkul and Chutimaskul, 2009; Blumler and Coleman, 2001).

Over the last decade, academics have been exploring ways to effectively utilize technological tools to support democratic process. Literature reveals different models of e-democracy that can help governments and developers structure e-democracy implementation. Among such include modes from the following bodies of knowledge:

Figure 1. E-democracy conceptual model
Clift, 2003.

Clift (2003), proposed a conceptual model of e-democracy as depicted in Figure 1. There are five elements that constitute the model: government, e-citizens, media, political groups, and media.

According to Clift (2003), the government provide extensive access to information and interact electronically with citizens. The political groups run online advocacy campaigns and online political parties' campaign, and the media and portal/search sites play a crucial role in providing news and online navigation. The "Private Sector" is commercially driven connectivity, software, and technology. In the model citizens are those who experience e-democracy as a whole (Clift, 2003). E-Citizens are individuals who use ICTs to participate in democratic process. This participation includes interaction with social groups, government agencies, media and private sectors. It also involves the ability to create and disseminate information, and demand for a more open and democratic society and/or organize social action in form of e-petition, political debates and policy dialogues.

Institute for Electronic Government (IEG) also proposed a four quadrant e-democracy model, which advanced/strategies the definition and implementation of e-democracy (Caldow, 2004). The model explores how government entity (representatives, political parties, legislative bodies, national and international organizations, etc) can successfully interpret and respond to the digital world and explore technology to advance influence (Caldow, 2004). The IEG model (Caldow, 2004) can help government determine its current state of e-democracy implementation and identify technological initiatives to undertake so as to move to the next level. The vertical axis of the model measures the degree of engagement while the horizontal axis measures influence.

The first quadrant discussed the early stage of e-democracy implementation which is characterized by passive and one-way asynchronous communication. E-democracy implementation at quadrant two of IEG model can help to achieve

two-way communication but is still asynchronous in nature (Caldow, 2004). The third quadrant describes advanced political entities collaboration. Although communication is still asynchronous, collaboration begins to emerge. Activities at this stage mostly concern political players and electoral process. Some of the activities include recruiting online volunteers, online fund-raising, campaigning, communication with media and constituencies. The fourth quadrant tagged 'Domestic Citizen Engagement' presents the most sophisticated implementation of e-democracy, which should be strategic, interactive, synchronous and global in nature. The crust of this quadrant is the advocacy for early integration of public input into policy making cycle so that public interests can influence policy outcomes. E-democracy implementation at this stage supports the Hansard Society's argument for the development of mechanisms for promoting public deliberation, embedding it within the constitutional process and demonstrating real links between public input and policy outcomes (Coleman and Hall, 2002; Caldow, 2004).

Macintosh (2004) identified key dimensions that are needed to characterize online political engagement initiatives. The dimensions include; level of engagement, political actors, technologies, rules of engagement, duration and sustainability, accessibility, evaluation and outcomes and critical factors for success. The critical factors for success dimension according to Macintosh (2004) is for researchers to capture political, legal, cultural economic or technological issues that stand out to make e-participation a success. Kotsiopoulos (2009) also argued that barriers to greater online citizen engagement in policy-making are cultural, organisational and constitutional and not technological.

In the next section, this article discusses in depth those various issues governments and researchers implementing e-democracy should be considering for a sustainable implementation.

CRITICAL SUCCESS FACTORS IN E-DEMOCRACY

In this section, we present a discussion on a diverse set of political, legal, cultural, economic or technological issues that governments and researcher need to consider in e-democracy implementation. Success factors in e-democracy implementation is divided into three (3) categories: Technological, Social-Cultural, and Political.

Political Factors

E-democracy is not all about technology; technology is just an enabler Kotsiopoulos (2009). This sub section highlights the importance of political and constitutional issues in ensuring successful and sustainable e-democracy implementation

Political Will: E-democracy will succeed where there is political power, will and leadership to make it work effectively by introducing the constitutional support and structural changes needed to integrate citizens' input into public decision making. This will include structural changes, constitutional amendment or procedural reform to support governments' effort on e-engagement initiatives.

Constitutional Change and Support: Democracy as a system of government is heavily influenced by institutional context and human agencies. In same vein online democratic initiatives need to have constitutional backing to gain acceptance across all level of government and enforce implementation. Integrating technology drive initiatives democratic processes usually requires structural changes and procedural reform involving development of e-democracy policy, formalization of the status of e-democratic tools (Millard et al., 2012) by integrating them into the decision making processes (Oni et al., 2014). Legal protection of the individual's rights of citizens to express themselves without fear, articulation of e-democracy policies and goals with national development programs and budget and legislative frameworks that guide implementation across all

levels of government. Clift (2003) said that "if e-democracy is not part of what is evaluated or budgeted, then the administrative and resource priorities within agency e-government efforts will not likely address the e-democracy responsibilities of governments".

Social-Cultural Factors

- **Publicity and Promotion:** Presently the most prominent promotional services in e-democracy platforms are link to social media site such as Facebook, Twitter, Flickr and Really Simple Syndication (RSS). This is good but limited to recruiting only active social media users. E-democracy requires diverse means of advertisement and publicity. Establishing e-participation platforms does not automatically imply that citizens will use them. A combination of off-line and online promotional platforms will help give citizens quick awareness. Off-line promotional avenues, such as bill boards, press releases and television and radio adverts should clearly give the electronic web platforms publicity (Macintosh, 2004). The online promotional routes such as web Ads, "tell a friend" postcards and clickable logos advertising the e-participation channels on related websites should complement the off-line modes.
- **Integration of Online and Offline Political Engagement Channel:** Technological tools should be made to align with established best practice in the democratic culture. Technology itself is not a solution to disengagement but has potential to ameliorate democratic apathy through adequate implementation. Integration of online engagements channels with traditional, "off-line" tools for citizens' participation in policy-making is important to derive the full benefit of ICT investment in democracy (Kotsiopoulos, 2009).

- **Online Feedback:** The essence of e-participation is to widen the level and volume of citizens' contribution in public decision making. Seeking and accumulating the opinion of people is not enough, it is important for them to have knowledge of what has become of their contribution and effort in participation. Appropriate feedback on citizens' input at any level of e-engagement can contribute to the overall transparency, accountability and openness of government and provide more motivation to participate (OECD, 2003). The feedback processes need to be timely, comprehensive, personalised (if need be), secure and credible. Providing appropriate feedback mechanism as part of the e-Engagement system will provide citizens with a clear idea of what they can expect in terms of government feedback to their input, as well as the degree to which their input is considered in the development of government policy (OECD, 2003). Feedback can be provided both during and after the consultation.
- **Resource and Investment:** E-democracy often requires huge financial investment and does yield little or no financial return. It is important to understand the financial implications of using ICTs to support political participation right from planning stage.
- **Moderation:** Moderation is important to effectiveness of online democratic participation. This involves determining the role(s) of each group of democratic actors and putting in place comprehensive rules to guide the actions of each individual in the system. The facilitators/ moderators must be seen as a reliable, non-partisan source of legitimacy to the whole process and establish measures to safeguard the integrity of participants.

Technological Factors

G

Beyond consideration for appropriate online tools to use to engage citizens in online public deliberation, there are other key technological issues to consider about online public participation user friendly, successful and sustainable. Technological issues such as accessibility, usability, reliability, security, authentication, interoperability need to be given due consideration right from the planning stage of e-democracy for acceptance and sustainability.

Accessibility: There is general accessibility guideline for web sites which include design for inclusion (www.W3.org/WAI) Accessibility in online engagement also includes having access to ICT tools and being able to get specific piece of government information. Accessibility issues ranges from 'digital divide' to 'design for all' (Coleman and Gotze, 2001). These must be critically considered when designing e-participation system. In as much as one may not be able to include everyone, e-participation systems designer need to be careful not to deliberately or by omission exclude any group of citizens. Government led initiatives also need to have policy guideline relating to accessibility so as to create checks and balances for designers.

Usability and Utility: Usability has to do with how easy the users find online engagement web user interface while utility refers to the system's design functionality. Usability and utility are equally important for the survival of online engagement systems as citizens need to find it useful and easy to use. Taking the role of ICT in governance and political participation beyond information provision to active participation both at grass root and national level will increase usefulness of the system. On the average, online engagement system should satisfy four basic usability criteria which are efficiency, intuitive, support and satisfaction (Coleman and Gotze, 2001).

1. **Efficiency:** This involves giving users a clear understanding of their work on the site, being able to keyboard to perform task on the site and fast response rate for good flow.
2. **Intuitive:** This can be described as the interactive behavior of online engagement channels. That is, consistence and behavior of every part of the system. This is important to helps users to easily establish proficiency each time they logon.
3. **Support:** Human being are liable to make mistakes, a good system design should help users to discover their error early and to easily undo. Online engagement channels should include intelligence to provide advice/reference materials.
4. **Satisfaction:** Users need to feel in control and experience some pleasantness while using e-participation channels.
5. **Content Clarity and Easy Navigation:** This is another usability criteria that e-participation systems must satisfy. This is very important because of the enormity of information on e-participation websites. If the website is difficult such that users cannot easily locate the right information or appropriate function, they will leave the web site no matter how usefulness it is. If the homepage fails to clearly state the various functions that users can perform on the site, people leave. It therefore connote that content of each page should be kept simple, clear and description of the function of the page. Involving users in system test early in the design process will to avoid difficulty after in content clarity and after deployment.
6. **Security:** This involves guide against threats such as hackers, worms and virus. Every on-line activity is prone to these attacks but the risk of getting hit by whatever kind of attack varies based on implementation platform and security mechanisms built into the system (Coleman and Gotze, 2001). E-engagement system are prone to more deliberate attacks ranging from terrorism to simple criminality (Coleman and Gotze, 2001) because of the various kinds of political activism that are involved in policy deliberation. Security and privacy issues to consider in e-participation begin with ensuring privacy of users' data. Electronic security requirements in e-participation systems include: protection of users' private data such as phone number and residential address, secure user's navigation, software protection and document security. As suggested by Parajuli (2009), government web sites should contain privacy statements as a proof of government responsiveness to protect citizens' information privacy. It is important to implement security and privacy measures in e-participation systems so that users can trust the system (Zissis et al., 2009). However, ensuring security should not cause trade off in transparency.
7. **Interoperability:** Electronic democracy entails the use of various channels of communication ranging from simple e-mails to complex online deliberation tools such as e-forum, e-petition, e-Panels etc (OECD, 2003; Zissis et al., 2009). To avoid replication of efforts among government bodies implementing e-democracy, it is important to establish efficient communication among software modules and web servers for resource sharing. Through interoperability, government agencies information and citizens' data can become a central reference for all online democratic processes within across the country. As suggested by Coleman and Gotze (2001) various online engagement channels running different platforms can speak to each other in a technical sense using XML-RPC to share resources among web servers and applications.
8. **Personalization and Customization:** Capturing and storing data on users' preference to provide recommendation and customization for future visit has been a viable tool to assist and retain online shoppers in e-commerce. In e-participation, making

users feel connected to the system through mechanisms such as personalization and customization will further appeal to their sense of engagement. This also involves defining various levels of membership which in turn determines the kind of conversations that each user can be involved. Giving users opportunity to set profiles and preferences the way they like. Also, given users subscription options such as notification of event and link to external social media site are attractive way of popularizing political discussion to promote political participation.

CONCLUSION

Active engagement of citizen in democratic process through ICT can reduce the disengagement between the representative and the electorate however, researchers, practitioners and government should have adequately consider the various of factors that will impact the success of e-democracy right the planning stage. This research article presents a collection of importance issues related technological factors, social factors and political factors in e-Democracy development and best practices in its implementation. It suggests that government agencies and researchers should take a more inclusive approach to evaluating e-democracy implementation. They are key issues to be considered to make participatory e-democracy user-friendly, effective and deliver the expected outcomes. These are technological, social and political, issues that make for good success in e-democracy implementation. These are beyond the traditional concerns of the digital divide.

KEY TERMS AND DEFINITIONS

E-Engagement: The use of information and communication technologies (ICTs) in supporting information, consultation and participation.

Interoperability: The capacity to move data between different software applications.

Online Consultation (E-Consultation): A form of electronic deliberation or exchange between government and citizens using the Internet.

Personalization: The process of tailoring web pages to individual users' characteristics or preferences.

XML-RPC: A set of implementations that allow software running on disparate operating systems, running in different environments to make procedure calls over the Internet (<http://xmlrpc.scripting.com/defaulty.html>).

E-Activism Development and Growth

John G. McNutt

University of Delaware, USA

Lauri Goldkind

Fordham University, USA

INTRODUCTION

The use of sophisticated technology to promote social change has developed over the past three decades from tentative beginnings to an expected part of the arsenal of movement organizations and advocacy groups. The development of practical politics throughout the world has made greater use of ever more sophisticated technologies. This article will discuss the nature of e-activism, the development of electronic social change activities, the organizational and practice issues, the research base and the potential future developments in the field.

BACKGROUND

For the purpose of this review E-activism is defined as the use of technology tools by activists for addressing policy issues and social problems. E-activism is also called Cyberactivism (McCaughey & Ayers, 2003), Cyberadvocacy (Bennett & Fielding, 1999), Electronic Advocacy (West & Francis, 1996; McNutt & Boland, 1999), Cyberprotest (Van De Donk, Loader, Nixon & Rucht, 2004), Liberation Technology (Diamond, 2010) and Digitally Enhanced Social Change (Earl & Kimport, 2011). The important components of the practice are that it is technology enhanced, issue oriented and used by activists for policy change. E-activism as a strategy itself is issue neutral, rather it is a constellation of tools which may be applied to any social issue and similarly, it is also value and morality neutral, meaning champions

on either side of an issue might employ the same strategy or tool to achieve radically different ends.

E-activism is strongly related to other concepts such as Cyber campaigning and Electronic Democracy, but there are important differences. Partisan political campaigning refers to efforts to change office holders, while E-activism looks at changing issues or problems. E-democracy (also e-participation and civic technology) often refers to the part of e-government that encourages citizen participation and involvement. The dividing line between these activities is often indistinct. The growth of civic technology has further complicated these already faint distinctions.

The techniques that e-activism uses to address issues or problems are often combined with more traditional methods used by advocacy groups and interest organizations. These traditional methods include community organizing, lobbying, administrative advocacy, petition campaigns, lawsuits and so forth. While less visible than these intervention tools, social change efforts have always been dependent on research and information gathering activities. Within the traditional advocacy arena, there is a well-established toolset for these activities that can be enhanced or replaced by technology tools.

Activists can combine community organizing, demonstrations, lobbying and electoral strategies with e-mail campaigns, mobile notifications using push technologies or short message services (SMS), social media efforts and sophisticated data analysis. Campaigns can also be waged completely online. This creates a situation where one may have online only efforts (pure e-activism), hybrid efforts

DOI: 10.4018/978-1-5225-2255-3.ch310

using a mix of technology tools and traditional social change tools and finally, efforts which are nearly completely traditional with small amounts of embedded technology.

E-Activism is used by a wide range of organizations in a variety of situations. These include traditional advocacy organizations, social movement organizations, political organizations and other types of associations and organizations. There is some evidence that the growth of technology and its capacities to reduce transaction costs have promoted the growth of virtual advocacy organizations and leaderless organizations (Earl & Kimport, 2011; Brainard, Boland & McNutt, 2012). Recent experience with the U.S Tea Parties, Occupy Wall Street, BlackLivesMatter and the Arab Spring Demonstrations appears to support this idea. In any case, technology is moving many social change organizations away from those described in the political science literature on interest groups or the sociological literature on social movement organizations. One illustration is the role of socialization of movement actors. Some of the activists who use these technology enhanced tools are amateurs while many are highly skilled political operatives. Conventional wisdom in social movements was that people worked their way into leadership positions through long hours of work at lower levels. They then became qualified to lead movement groups and organizations. This is also reflected in the political participation literature in discussion about civic skills and the value of associations (Verba, Schlozman & Brady, 1995—See also Smith, Schlozman, Verba & Brady, 2009). The work of Earl and her colleagues demonstrates that technology can change this dynamic in important ways, creating the opportunity for new activists to conduct campaigns without previous experience (Earl & Kimport, 2011; Earl, 2007; Schussman & Earl, 2004).

Technology changes organizations in important ways. It makes them flatter and often changes the economics of productions. In terms of social change organizations, it can minimize the need for

the bricks and mortar facilities that older organizations found essential and makes distributed work possible. This creates issues for theories, such as resource mobilization theory in sociology, that assume that these facilities are essential and the activities (such as fundraising) to support them are crucial. The rise of the so called sharing economy may push this further as activists become familiar with technology led collaboration. Scholars will have to reconcile these issues as knowledge building goes forth and new paradigms for organizing work are coming on line based on the ability of connecting workers to consumers via technology without a centralized or organizing core.

Increasingly technology is essential to E-activism, but it frequently requires a set of techniques to make the technology useful in political situations. While there are tech tools specifically written or developed for political applications, more often, activists use technology developed for another reason. It then becomes the task of a thoughtful person to adapt the technology to the new use. Sometimes this means modifying the technology in some fashion but usually it means changing the way it is used. This might be thought of as a new technology in its own right.

The Evolution of E-Activism

Many people think that technology in activism evolved in the past few years. While it is true that the growth of this practice grew quickly in the recent past, there were efforts in the 1980s that blended technology to social change activities (Downing, Fasano, Friedland, McCollough, Mizrahi & Shapiro, 1991; Schuler, 1991; 1996). Most of the technology that was used during this early period would be considered primitive by the standard of today's cutting edge efforts. These included Bulletin Boards, newsgroups, e-mail and early mapping systems. The overwhelming majority of the technology used was developed for some other purpose. It should be noted that many potential users did not have access to the

Internet or other technologies at this point and those that did found a very different situation than we have today.

The growth of technology, along with the accumulated experience of the social change community, led to more capable and robust efforts. They used the emerging World Wide Web, sophisticated e-mail efforts and the beginnings of online fundraising and online petitions. This phase also saw the development of advocacy oriented technology. In the related area of political campaigning, major political parties started using technology in earnest. While it paralleled their face to face and mass media strategies, technology had made a foothold in the land of partisan political campaigning. This technology augured well with the managed politics that placed control of campaigns in the hands of political professionals and consultants. It allowed for a high degree of message control, a touchstone of both electoral and issue advocacy at the time.

In the early part of the last decade there was change afoot. New technology, often called Web 2.0 or Social Media (Germany, 2006; Bryant, 2006; Madden & Fox, 2006) began to develop a larger following in both society at large and the political system. These techniques promote user generated content, the development of collective intelligence, networking and a high degree of interactivity. They were a poor fit with message control and professionalized politics. There was some experimenting, however, with new forms of campaigns. The Howard Dean Campaign in 2004 experimented with a variety of Web 2.0 tools including Blogging, Meetup and computer gaming (Trippi, 2004; Cornfield, 2004; Teachout & Streeter, 2008). While Dean eventually lost, his campaign demonstrated how these new technologies could be used. In 2008, Barak Obama took what Dean had learned and developed a campaign that ended in victory. His technology actively involved supporters in his campaign, rejecting the logic of a more managed campaign. Other campaigns throughout the world moved toward

this approach (Davis, 2005; 2010). These developments in cyber campaigning were complemented by a similar evolution in issue advocacy and social movements. It is fair to say that diffusion of techniques from various sectors is frequent and quick. Specialist in digital campaigning are emerging in almost all arenas.

The wide scale introduction of wireless technology joined with new software developments and innovative ways to use the technology have changed the landscape of activism. The emergence of Occupy Wall Street (Chen & Pirolli, 2012; Gaby & Caren, 2012) and the revolutions in Northern Africa and West Asia, often called Arab Spring (Lim, 2012; Hamdy & Gomaa, 2012; Tufec & Wilson, 2012), attest to the power of e-activism. These face to face movements were fueled by the power of technology.

Technology continues to evolve and activists continue to make better use of the tools that they have. The use of Big Data, predictive analytics and Data Mining, applied to selecting potential supporters and contributors, represents a major thrust. The further development of mobile technologies and the integration of social media approaches top mobile technology promises even larger gains. Finally, in organizations all around the world dedicated men and women are building new ways to use technology in the service of social change.

How E-Activism Works

The practice of e-activism varies from setting to setting, but there are commonalities that tend to be reflected across the board. In general, e-activism practice can be reflected as a series of four processes: Advocacy Research, Informing the Public, Coordinating and Organizing and finally, Applying Pressure. These four processes play out in different patterns within an e-activism effort. This is not to imply that there is a top down process but only that activities tend to coalesce around a series of activities.

- **Advocacy Research:** Activism may be fueled by commitment and range but it also runs on information. This includes information on policies and problems, information on opponents (Opposition Research), information on potential supporters or voters and a variety of other data needs. This information has always been collected on behalf of activist causes, often by hand. The growth of technology makes gathering all of this information easier to collect, store and analyze. In recent years, the ability of activists to use sophisticated data analysis has taken this process to a new level. Data mining, network analysis and sophisticated statistical analysis techniques, combined with advanced data visualization and mapping techniques are available to many social change groups that could not have dreamed of such capacities a few years ago. Databases developed for marketing purposes bring new sources of information about voters and potential supporters. People who are likely to support a cause can be identified using a variety of new tools. What this means is that activists can now enjoy an enriched information environment that can support the other three processes in a substantial fashion.
- **Informing the Public:** This process includes both making the public aware of a problem or issue and educating the public and supporters about the nature of the concern. The growth of technology means that activists can design a wide variety of message using multiple sources (such as video, text, voice, pictures and so forth) and targeted to individual recipient characteristics. The information developed by the advocacy information function can be readily applied to both message design and selection of recipients.

At a basic level, e-mail, websites, social media (particularly Social networking sites, blogging and

microblogging), discussion lists and so forth are frequently used (McNutt & Barlow, 2010). Also used are online videos (such as YouTube) and static pictures. The Invisible Children's video Kony2012, for example, targeted an African Warlord and drew a substantial audience. Online mapping is useful where there is a spatial issue. This last technology has been especially useful to environmental advocates who can use it to display proximity to natural hazards. Also useful is e-learning technologies such as Moodle and teleconferencing systems.

- **Organizing/Coordinating:** The activity needed to focus social action can be time and effort intensive, which limits the size of the activity. In addition, the impact of distance is to make the process both harder and less effective. These challenges are serious for domestic activism and represent major barriers for international activism. One might consider these the transaction costs of organizing.

Technology allows us to reduce these costs (Earl & Kimport, 2011) and extend capacity and reach. Early on, newsgroups and bulletin boards provided this technology help to activists. E-mail and websites were also helpful and the range of social media technologies added new dimensions (see Guo & Saxton, 2012). The impact of emerging mobile technologies is just now being felt and the potential is enormous. Some of those developments were seen in the streets of Egypt and Libya. Facebook and Twitter, combined with mobile technology, were certainly critical in organizing the face to face demonstrations. Involving people is central to activism, either in traditional campaigns or in cyberspace.

- **Applying Pressure:** Finally, technology can be used to pressure decision makers. Early approaches included e-mail campaigns, on-line petitions and Internet fax efforts. Later efforts combined social me-

dia and more sophisticated comprehensive advocacy suites. Disruptive efforts include hacking, client side denial of services attacks and theft of confidential data. While early campaigns were combined with face to face efforts there have been Internet only campaigns (Such as Move On's Million Mouse March against the US Invasion of Iraq). As the practice of e-activism developed, so did the e-democracy element of e-government. Decision makers began to use the Internet actively in both their personal campaigns and in engaging constituents. These two forces tax government technology. A 2005 report from the Congressional Management Foundation found that Congressional Offices in the United States were encountering ever more pressure online and were struggling to keep up with the level of activity, which can only have accelerated in the past decade.

These four processes play out in e-activism efforts in a variety of ways. As the context and problem change, different processes become dominant. The capacities that they signify represent a major move forward for the practice of activism. Not every activists organization can or will use these new capacities. Every organization, however, can make improvements in what information they gather and how they use and interpret that material.

Concerns and Controversies

There are a number of challenges that face e-activism as a practice. These include the digital divide, confusion with other activities, conflict with traditional approaches to social change, There is also the question of how these techniques are used and to what effect.

The Digital Divide: In the 1990s and early 2000s the digital divide most often referred domestically to groups of individuals without adequate resources for engaging with internet technologies (Ebo, 1998;). With the rise of

digital technologies embedded in telephones and national outreach and implementation of wireless in public spaces as well as educational institutions the newest iteration of the digital divide focuses on organizations. Nonprofits have often lagged behind the corporate and government sectors in using information and communication technology effectively (McNutt, 2008; Cordes & Rafter, 2007). This situation may be more pronounced in organizations that are small and underfunded, such as advocacy organizations. In some cases, it is clear that they do not have this capacity or do not utilize the technology adequately, and it is unclear what supports exist to help the sector to catch up and/or adequately implement such technologies. Collectively this set of circumstances is referred to by organizational scholars as the organizational digital divide (McNutt, 2008). The individual digital divide, coupled with the organization digital divide can limit the potential of activism to engage people and achieve meaningful results.

- **Confusion With Other Activities:** Over the years, there have abortive attempts to define e-activism as part of alternative journalism or part of virtual volunteering. These efforts, while well meaning, are conceptually and practically flawed. They seize on small parts of the overall phenomena and ignore the rest. At the same time, there are those who feel, for a variety of reasons, change efforts conducted online cannot be considered to lead to tangible change.

While blogging might be considered journalism and online video might fit into earlier conceptions of alternative media, it would be very problematic to consider the lobbyists, community organizers, campaign consultants and so forth that use these technologies in social change efforts as journalists. Much of the effort has little to do with informing the public as more traditional alternative social movement media once had.

Equally, while there are virtual volunteering opportunities in social change campaigns, many of the practitioners of E-activism technology are not volunteers. Engaging the public to participate in their government is not volunteering, nor is voting or jury duty.

Conflict with Traditional Social Change Advocates: Some supporters of traditional methodologies have argued that “real change only happens off-line” (see Kohn, 2008). Social critic Malcolm Gladwell (2010) made a similar argument, disparaging those who use online as opposed to offline activism. This is more of an ideological argument, as opposed to an empirical one. Earl and Kimport (2011) point out that empirical evidence to support this contention is generally lacking. There is little research to support the contention that tradition efforts are better. Realistically, many traditional activists have embraced the new technology.

While not really a controversy, it ought to be noted that advocacy groups working on pro-social change efforts are not the only ones to benefit from this new technology. Hate groups, terrorist organizations and criminal cartels can use the same e-activism technology in the same way as more positive organizations. Astroturf, deceptive efforts to mimic public participation, can also use this technology.

FUTURE RESEARCH DIRECTIONS

There is a substantial research base on e-activism and its related concepts. In addition, a growing body of research aimed at understanding how people interact with technology in a variety of settings is being developed. Social scientists in a variety of disciplines including political science, communications, sociology, public administration, social work, law and anthropology are working to help us understand these new phenomena. Some areas where new research and theory building include:

1. **Intervention Research:** More substantial research on the effectiveness of specific interventions. While there is a growing body of intervention research, so using experimental designs, more are needed. These new studies ought to reflect different target populations, problem areas and different levels of practitioner abilities.
2. **Research on the Interaction Between Governments and Advocacy Organizations in Cyberspace:** The interaction between government, politics and advocacy organizations in an online environment ought to be studied as a dynamic entity. This must go further than studies which look at acceptance and satisfaction of e-government efforts. This would allow more sophisticated modeling of online campaigns.
3. More research that seeks to use the findings of the existing research base to inform e-activism. Researchers in many disciplines have amassed a substantial pool of research on how people and groups engage in online environments. While most of this research does not directly involve e-activism, many of the findings could be applied to designing e-activism interventions if they could be synthesized.

CONCLUSION

We live in a world with a considerable number of threats to social justice and human dignity. The efforts of those who seek to redress these wrongs have always involved difficult tasks with long odds for success. As an effective new tool, technology can lighten those burdens and make success more likely.

E-activism has evolved from an experimental practice to a major set of tools in the arena of social change. The practice today bears little resemblance to what once was. The potential for future development is almost unlimited.

KEY TERMS AND DEFINITIONS

Activism: An effort to promote social change through a variety of traditional and electronic techniques.

Astroturf: Deceptive efforts to simulate popular support or involvement in the interest of a policy goal or effort.

Civic Engagement: Or civic participation has been defined as the individual and collective actions designed to identify and address issues of public concerns. It is the rights of the people, citizens, to define the public good, determine the policies by which they will seek the good, and reform or replace institutions that do not serve that good.

Social Change: An alteration in the social order or fabric of society in the US indicating a change

in social policy at the city, state or federal level. Social change may include changes in organizations, social institutions, the governance process or social relations.

Web 2.0: Refers to a set of technology tools that emerged in the first decade of the 21st century and are characterized by interactivity, pooling of collective intelligence, the Internet as platform and the promotion of user generated content. Web 2.0 is also referred to a Social Media.

North South University, Bangladesh

INTRODUCTION

The importance of privacy and trust for e-Government services has been evidenced in numerous past studies, but there is a paucity of research regarding the effects of these factors on the acceptance and use of e-Government services in a developing economy. This study fills into the void by aiming to conceptualize the proposed constructs of privacy and trust to examine the factors that can influence future use intentions for e-Government services in the context of Bangladesh. To pursue this purpose, the unified theory of acceptance and use of technology (UTAUT) model has been used. Findings will provide further insights into understanding and managing current and potential users of government services via the online platform. This study can also assist various government authorities to consider the idea of providing appropriate

e-Government services to aid the urban people for communicating and conducting transactions in a timely fashion.

BACKGROUND

In recent times, e-Government services are a breakthrough of communication and transaction between the government and citizens. The communication of e-Government broadly has three

categories, namely Government to Citizen (G2C), Government to Business (G2B) and Government to Government (G2G) services. Among these, it is basically the G2C services which most of the governments from developed and developing countries are focusing upon today.

G2C services relates to the ability of government and citizen to communicate information to each other in an efficient and electronic manner. Its sole purpose is to provide information and assistance to citizens including links to renew a passport, download visa forms, file tax returns, etc (Schaupp, Carter & Hobbs, 2009). In fact, G2C has enabled many governments to become more responsive to the needs of its citizens, ultimately resulting in less corruption, increased transparency, greater convenience, revenue growth and cost reductions (Suki & Ramayah, 2010).

In Bangladesh, a task force of information and communication technology (ICT) was formed in 2001 in order to introduce e-Government services. However, due to lack of proper planning, e-Government services for G2C could not be implemented on a large scale. Today, the present government of the country has again initiated a priority-based project regarding

e-Government services in order to promote their vision of a 'Digital Bangladesh'. Under 'Digital Bangladesh' the aim is to increase momentum in efficiency and technological enhancement in government system and its performance (Islam

& Khair, 2012). For this reason, the government has started pilot e-Government projects in various sectors of Bangladesh and it is being implemented under the Ministry of Planning. Also, the government is arranging substantial foreign co-operation in terms of financial assistance and technical collaboration for realization of e-Government services in the country at a national scale (Alam, 2012).

Despite being a developing country, Bangladesh has come to a fast realization that ICT is necessary for promoting economic growth as well as good governance. The primary goal of

e-Government projects in Bangladesh is therefore to establish a relationship between government officials and citizens by providing greater access to government information and services from all parts of the country. Moreover, increasing government accountability by making its operations more transparent can reduce the opportunities for corruption and support sustainable development goals by providing business, rural and traditionally underserved communities with information, opportunities and communications capabilities (Hassan, 2013). Due to this growing phenomenon of e-Government services, Bangladesh even managed to attain the 148th position in world e-Government ranking compared to its 2012 ranking of the 150th position (UN, 2014).

Although e-Government services is potentially a route to the provision of better services delivered to citizens at a lower cost, there is still a low level of acceptance of such services in many developing countries, particularly Bangladesh. Since the success of such services largely depends on citizens' perceptions of the offered services, it is important to explore the factors that may influence the adoption of e-Government services by the citizens of Bangladesh.

ISSUES, CONTROVERSIES, AND PROBLEMS

Today, information technology is the driving force for reform and change in the globalized

world and it is necessary that institutions at all levels employ this trend to become more effective and accessible. The issue of e-Government thus gained momentum since government is an important instrument of public administration that is used to render services for the citizens. Use of technologies in delivering public services can improve the capacities of government institutions as well as the quality of life of citizens by redefining the relationship between citizens and their government. Initially, this may seem as another option for communicating with citizens; however, in the face of rising demands from demographic, economic, social and global trends,

e-Government no longer appears to be a matter of choice, but a necessity for any country.

Many developed countries today have achieved significant progress in implementing e-Government services, but it is particularly a challenge for the developing nations to make government services easily available and accessible over the electronic network to their citizens. This is because of social issues like lack of awareness or Internet access, IT literacy and language barriers, along with financial and political constraints or technical complexities like the need of a strong infrastructure for information technology (Chowdhury & Satter, 2012). All these factors largely impede the implementation of e-Government services in developing countries.

Moreover, there are very real concerns about turning over personal information to the government. While the government may seem like a benevolent organization, it is possible that threats can come from external sources, like professional hackers, criminal or terrorist organizations, intelligence and investigation agencies, etc who may misuse citizens' information for financial or other gains (Alam, 2012). Citizens therefore need to be assured that this information will be treated in an extremely secure environment, so that the information they have listed with the government cannot make them the victims of reprisals by disaffected government workers.

Many citizens may also be reluctant to adopt e-Government services in a developing country

due to a lack of trust in the security of online transactions and concerns regarding the use of information submitted electronically. These security concerns are not without merit. In light of the inherent uncertainty of using an open technological infrastructure like Internet, citizens want assurance that their online interaction with the government is secure and reliable. While

e-Government has the potential to improve government transparency, responsiveness, and accountability, the services will only be adopted over the electronic network if citizens deem them trustworthy (Belanger & Carter, 2008).

Following Tranfield, Denyer & Smart (2003), incorporation of a good systematic review into any research makes it easier for people to understand by synthesizing extensive evidences from prior studies. This chapter has therefore applied an evidence-based approach to enhance the legitimacy and authority of results that were found in this study. For instance, this research has found significant evidences in favor of lack of trust and privacy as biggest challenges in the path of adoption of e-Government services. Impressive bodies of academic research like Alsaghier, Ford, Nguyen & Hexel (2009), Mahadeo (2009), Chan, Thong & Tam (2010), Featherman, Miyazaki & Sprott (2010), Hussein, Mohamed, Ahlan & Mahmud (2010), Alzahrani and Goodwin (2012) and Mamta (2012) have evidently argued that the lack of trust in the service or service provider and concerns over privacy and security of personal information are the key reasons behind citizens' hesitancy to adopt e-Government services. However, very few studies have focused on these two dimensions in particular from the perspective of a developing country. This study thus attempts to significantly contribute to the literature by conceptualizing a proposed research model to investigate the influencing factors for e-Government services in the context of Bangladesh.

RESEARCH MODEL AND HYPOTHESES

The purpose of this chapter is to determine the factors that can explain and predict citizens' intention to use e-Government services in Bangladesh. To conduct this study, the UTAUT model has been used. Venkatesh, Morris, Davis & Davis (2003) developed the UTAUT model to be used extensively as a baseline to investigate a variety of technologies. The original model comprises of four primary factors: performance expectancy, effort expectancy, social influence and facilitating conditions. However, given the number of technology devices, applications, and services that are targeted at consumers in recent times, Venkatesh, Thong & Xin (2012) introduced a revised UTAUT2 model to identify factors that can influence consumer adoption of technologies (Stofega & Llamas, 2009).

This study therefore chose the original UTAUT and UTAUT2 model as a theoretical foundation to develop a proposed research model. In addition to the original four key constructs, two additional constructs, drawn from previous literature of e-Government services, has been incorporated to make a significant theoretical contribution to the user context of the conceptual model. The proposed model is presented in Figure 1. In addition, all the variables hypothesized in this study and their probable relationships towards citizens' acceptance and use of e-Government services has been discussed next.

Performance Expectancy

Performance expectancy has often been proved as the strongest predictor of the intention of adopting technology-based services (Venkatesh et al., 2003). For this chapter, performance expectancy has been measured by the perceptions of using e-

Figure 1. The proposed research structure

Government services in terms of benefits like saving time, effort, improving the quality of services or facilitating communication with government authorities (Schaupp et al., 2009). Several prior studies by researchers like Alzahrani and Goodwin (2012) and Imarah, Zwain & Al-Hakim (2013) have proved that this construct has considerable influence on individual intention of adopting e-Government services. As a result, the following hypothesis has been proposed:

H1: Performance expectancy significantly affects individual intention to use e-Government services.

Effort Expectancy

Effort expectancy is considered to be directly related with the ease of using a particular technology. According to Venkatesh et al. (2003), effort-oriented constructs like perceived ease of use, complexity and ease of use act as more salient factors under this construct. Past studies have examined direct and indirect effects of effort expectancy on the adoption of e-Government services and have reported mixed results. While Alzahrani and Goodwin (2012) stated that effort

expectancy does not really influence individual intention to use e-Government services, several other researchers like Mcleod, Pippin & Masion (2009) and Imarah et al. (2013) proved the existence of considerable impact of this construct. Therefore, the following hypothesis has been proposed:

H2: Effort expectancy significantly affects individual intention to use e-Government services.

Social Influence

Social influence has been acknowledged as a significant construct in many prior studies by researchers like Venkatesh and Davis (2000) and Lopez-Nicolas, Molina-Castillo & Bouwman (2008). The idea behind social influence is that even if people are not themselves favorable towards a particular technology, they may choose to adopt it because people who are important to them think they should use that technology. This construct has already been used by Imarah et al. (2013) and Barati and Bakhshayesh (2015), where its influence on adoption of e-Government services was supported. This study thus hypothesizes that:

H3: Social influence significantly affects individual intention to use e-Government services.

Facilitating Conditions

Many prior empirical studies have proved that facilitating conditions, in terms of resources and technology, influence citizens' intention to adopt e-Government services. Studies by Chan et al. (2010) and Imarah et al. (2013) claimed that all things being equal, an individual with a lower level of facilitating conditions will have lower intention to use e-Government services. On the other hand, few studies like Carter and Schaupp (2008) found facilitating conditions to be an insignificant determinant of individual intention of adopting e-Government services. Hence, the following hypothesis has been developed:

H4: Facilitating conditions significantly affects individual intention to use e-Government services.

Privacy

Adoption of any kind of e-Government services is severely influenced by the security and privacy concerns of citizens (Alzahrani & Goodwin, 2012). An individual who uses e-Government services relies on the system privacy and expects that no personal information will be disclosed to unauthorized people or authorities (Mcleod et al., 2009). Several empirical studies like Featherman et al. (2010) and Alzahrani and Goodwin (2012) have argued that higher the risk of breaching privacy, lower the willingness will be to adopt e-Government services, particularly in a developing country. This study thus poses the following hypothesis:

H5: Privacy significantly affects individual intention to use e-Government services.

Trust

According to El-Wajeeh, Galal-Edeen & Mokhtar (2014), trust of the citizens in the government providing electronic services and the trust they possess in electronic network and information technology are both essential for adopting e-Government services. Besides, prior experience of an individual with e-Government services also plays a major role in creating this trust. Many empirical studies like Hussein et al. (2010) and Mamta (2012) have found significant positive association between trust and individual intention to adopt e-Government services. Thus, the following hypothesis has been conceived:

H6: Trust significantly affects individual intention to use e-Government services.

Behavioral Intention

Behavioral intention is the most important indicator of the ultimate adoption decision for a technology-based service (Nisha, Iqbal, Rifat & Idrish, 2015). For e-Government services, behavioral intention can be defined as the strength of the prospective users' intention to use or to support the adoption of e-Government innovations. Mahadeo (2009) and Imarah et al. (2013) further found significant positive correlation between behavioral intention and actual usage of e-Government services. As such, this study hypothesizes that:

H7: Behavioral intention significantly affects individual usage behavior of using e-Government services.

DATA ANALYSIS AND DISCUSSION

Data for this study has been collected using a structured questionnaire on a sample of 1200

respondents, who mostly represent the urban population of Bangladesh. Respondents were selected on the basis of probability sampling and a stratified random sampling method and after a three-week survey, 966 completed and usable responses were obtained from the survey.

The quantitative survey contained 26 statements in order to evaluate the constructs of the proposed model. Scales for performance expectancy, effort expectancy, social influence, facilitating conditions and behavioral intention were adapted from Mahadeo (2009), Schaupp et al. (2009), Hussein et al. (2010) and Imarah et al. (2013). Alternatively, scales for privacy and trust were based on Chan et al. (2010), Featherman et al. (2010) and Alzahrani and Goodwin (2012). All these items were measured using a five-point Likert scale, ranging from “strongly disagree” to “strongly agree” and were adapted from previous studies on e-Government services - with minor changes in wording to tailor them to the context of Bangladesh. This ensured the content validity of the questionnaire used to assess each constructs depicted in Figure 1.

The conceptual research model was tested using the structural equation modeling (SEM) facilitates of SmartPLS. SEM was applied to investigate the underlying relationships between the range and quality of e-Government services, focusing particularly into urban citizens’ behavioral intentions. SEM has the ability to isolate observational error from measurement of latent variables like the proposed constructs of privacy and trust in this study. Thus, the use of SEM for evaluating e-Government service adoption is the unique contribution of this chapter, since to the best of the authors’ knowledge SEM has not been used for any e-Government research in the context of Bangladesh.

As such, through partial least squares (PLS) method, first the measurement model was examined to assess the reliability and validity of all variables and then, the structural model was analyzed to examine the relationships hypothesized in the research model.

MEASUREMENT MODEL ANALYSIS

Table 1 and Table 2 present the measurement results regarding the reliability, validity, correlations and factor loadings. Composite reliabilities of constructs ranged between 0.818 and 1.000, which exceeds the stated 0.7 cut-off value (Nunnally and Bernstein, 1994). In all cases, average variance extracted (AVE) was greater than 0.5 and greater than each square correlations as well, which confirms both convergent and discriminant validity of the model (Fornell and Larcker, 1981). In addition, the internal consistency reliabilities (ICRs) of multi-item scales modeled with reflective indicators were observed to be 0.75 or greater, suggesting adequate reliability. The pattern of loadings and cross-loadings even supported internal consistency and discriminant validity, with few exceptions: one item from social influence and facilitating conditions, and two items from privacy and trust were deleted due to their low loadings and high cross-loadings.

STRUCTURAL MODEL ANALYSIS

Figure 2 presents the path coefficients and significance levels in the structural model of this study. The constructs of trust (0.301, $p < 0.05$), facilitating conditions (0.277, $p < 0.05$) and effort expectancy (0.198, $p < 0.05$) were observed to have significant and positive paths to behavioral intention of users for e-Government services, in their order of influencing strength.

However, the constructs of performance expectancy (0.141, $p > 0.05$), social influence (0.122, $p > 0.05$) and privacy (0.009, $p > 0.05$) reported an insignificant path towards the individual behavior of using e-Government services. Therefore, all hypotheses (except H1, H3 and H5) dealing with behavioral intention to use e-Government services are supported. Subsequently, the hypothesized relationship between behavioral intention and usage (0.321, $p < 0.05$) is found to be statistically significant, thereby supporting hypothesis H7.

Table 1. Factor loadings, composite reliability and AVEs

Constructs	Items	Factor Loadings	Composite Reliability	AVE
Performance Expectancy	PE1	0.807	0.895	0.688
	PE2	0.847		
	PE3	0.850

CONCLUSION

The primary objective of this chapter is to provide a conceptual model that determines the influencing factors of citizens' intention towards the use of e-Government services. Lack of studies in the area of G2C adoptions is a major reason why such study

is required to obtain a clear picture of the current status of e-Government implementation particularly in developing countries. Thus, the findings are expected to make a significant contribution to the emerging literature on e-Government adoption by employing new variables like privacy and trust into the well-accepted UTAUT model. Results

Figure 2. Results of structural equation modeling

reveal that factors like trust, facilitating conditions and effort expectancy play a deterministic role in persuading citizens towards the adoption of

e-Government services in Bangladesh. These antecedents of intentions are perceptual in nature and they can be influenced by appropriate promotional campaigns through fairs and seminars, demonstrations, ministry-funded projects, various online portals, etc. Furthermore, the research model could be used as a reference for studies to cater different forms of e-Government technology.

SOLUTIONS AND RECOMMENDATIONS

This study has revealed quite a few understandings towards the possibilities of potential usage of e-Government services. Constructs such as trust, facilitating conditions and effort expectancy saliently influence behavioral intention, which directly stimulates the usage of e-Government services. Results here imply that citizens are more likely to trust the service if they are convinced with the credibility of the service and the service provider. For e-Government services, trust in the

government and Internet is therefore critical in order to mitigate any uncertainty or vulnerability in the information exchange. Moreover, as e-Government services are mostly going to depend on the extensive use of the electronic network, technical aspects like computers and information systems needs to be stable and reliable to convince citizens for adopting such services. Findings further state that less effort input by citizens while availing e-Government services are more likely to show positive attitude in embracing the service in Bangladesh.

Conversely, performance expectancy, social influence and privacy are identified as insignificant factors of behavioral intention for the citizens of Bangladesh. This implies that citizens may simply choose to reduce their effort for any government services and may trade-off their privacy concerns for this convenience. On the other hand, citizens are not expecting much relative advantage from e-Government services and this may be due to the initial stage of the implementation of such services in Bangladesh. Additionally, positive or negative evaluations from familiar people are less likely to influence the citizens of Bangladesh to consider the adoption of e-Government services.

The inclined reasons behind such findings are mostly shaped by the local culture and infrastructure of the country. As such, important implications for practice are discussed next. To attain trust and increase citizens' adoption of e-Government services, the government needs to increase awareness regarding these new offerings. For this purpose, the government may arrange fairs or seminars related to ICT, where they can demonstrate the electronic government services available to the citizens. Moreover, if local information booths can be established in every ward of the capital city, then it would help citizens to gather information about e-Government services and hence, pave a way for establishing trust. Additionally, it is important that the government ensures faster and cheaper internet connections, computer facilities at low cost and skilled human resources to train people for using electronic networks. This will enhance the facilitating conditions for promoting e-Government services in Bangladesh. In fact, the government has already taken few initiatives by encouraging computer literacy for both urban and rural people alike. However, the government can commence more ministry-funded projects and outsource the training or facilitating services to registered ICT organizations. They can even establish an online platform where all government services will fall under one umbrella. For instance, there will be a collection of portals related to citizens' advice bureau, applications and renewals for passport, national identification card or driving license, utility bill payments, metropolitan police, city corporation tax, and government announcements. 24/7 update, call centers, video clips on 'how to do' issues in both the native and English language, along with mobile applications may also be developed to facilitate e-Government services in Bangladesh. Besides, demonstrations through short films in public places or advertisements over television channels or radio platforms can be utilized to educate people and enhance trust for e-Government services. Demonstrations should be

such that it clearly reflects the benefits and ease of use of the e-Government platform. Not only that, competencies of the government officials and their assurance to help with the electronic network needs to be highlighted as well, so that it helps to motivate citizens to use e-Government services in Bangladesh.

A common culture in developing countries is to visit the physical place in order to avail any service. Bangladesh is no different and for the betterment of the country, the government needs to mandate the adoption of the electronic network for any government related services. For this, lower fee for electronic services compared to manual paper-based services can be promoted and all government-related information must only be available online. This will prompt citizens to consider the adoption of e-Government services in Bangladesh.

LIMITATIONS AND FUTURE RESEARCH DIRECTIONS

Like most empirical research, this study has several limitations. First, the conclusions drawn from this study are based solely on the urban population of Bangladesh. Future research can examine a wider respondent base by considering the rural population. Primary research methods like face-to-face interviews can be used to gather reliable data in this regard. Moreover, this study has mainly employed the UTAUT model but a longitudinal study can be adopted in future works. In fact, use of moderators like age, gender and voluntariness in the research model may provide a better insight into the perceptions of e-Government service users. Also, additional constructs like perceived self-efficacy, perceived risk, personal innovativeness, etc., can be added in the research model to enhance understanding of individual users' intention to adopt e-Government services in Bangladesh.

KEY TERMS AND DEFINITIONS

Behavioral Intention: Individual intention to use a particular technology that directly affects actual usage.

Effort Expectancy: Degree of ease associated with the use of a technology.

e-Government: Information system used to conduct government transactions and communicate with citizens via Internet.

Facilitating Conditions: User perception that resources and support are available to perform a particular activity.

Performance Expectancy: Degree to which using a technology provides benefits to the user in performing a particular activity.

Privacy: A belief that personal information entered into an information system will remain private and secure.

Social Influence: User perception that important others like friends or family believe they should adopt a particular technology.

Trust: Confidence in the online environment and the electronic services provided by Government.

Mastering Electronic Government in the Digital Age

Kijpokin Kasemsap

Suan Sunandha Rajabhat University, Thailand

INTRODUCTION

The ultimate goal of electronic government (e-government) is to offer the increased portfolio of public services to citizens in a cost-effective manner. Most governments make tremendous efforts to deliver the online services to citizens (Roy, Chartier, Crete, & Poulin, 2015). The operation of information and communications technology (ICT) has been the major development of e-government in the past decade (Reddick & Anthopoulos, 2014). ICT has altered public administration by transforming the internal processes and external interactions (Meijer & Bekkers, 2015). E-government services must be redesigned to ensure that the benefits of ICT systems are completely employed (Kasemsap, 2016). The most significant role of ICT is to drive the organizational innovation through information systems and solve the crucial problems that the government cannot solve on its own (Sindelar, Mintz, & Hughes, 2010).

E-government has emerged as an effective method of delivering government services to citizens (Weerakkody, Dwivedi, & Kurunananda, 2009). The diffusion of e-government is an international phenomenon (Carter & Weerakkody, 2008). As an integral part of administration modernization (Stier, 2015), e-government is one of the most important ways to bridge the digital platform in developing countries (Venkatesh, Sykes, & Venkatraman, 2014), acts as an effective exploration of government innovation (Wu & Guo, 2015), and can improve the government performance and create the new public value for citizens and businesses (Wang, 2014). The success of e-government system lies with its cost savings

in implementation, adoption, benefits provided to the recipients of the system, and associated risks in operating the system (Weerakkody, Irani, Lee, Osman, & Hindi, 2015).

This article aims to bridge the gap in the literature on the thorough literature consolidation of e-government. The extant literature of e-government provides a contribution to practitioners and researchers by describing the multifaceted applications of e-government to appeal to the different segments of e-government in order to maximize the public sector impact of e-government in the digital age.

BACKGROUND

Regarding e-government, ICT is an effective instrument for reducing the role of bureaucracy in government organizations (Cordella & Tempini, 2015). There has been a social evolution on the Internet recognized as the Web 2.0 (Waters, Burnett, Lamm, & Lucas, 2009). Web 2.0 is characterized by enabling and encouraging participation through open applications and through services with rights granted to use content in the new and exciting contexts (Chadwick, 2009). The adoption of ICT in public sector organizations has been associated with the e-government reform programs aiming at reducing the inefficiencies generated by the bureaucratic burden (Osborne & Plastrik, 1997). The levels of human and technological development of a country are the driving forces of e-government (Siau & Long, 2009).

Global interest in e-government has produced a wide range of internal and external evaluations of national performance in service delivery (Taylor,

Marshall, & Amiri, 2010). E-government standard describes how governments work, share information, and deliver services to the internal and external stakeholders (Sun, Ku, & Shih, 2015). ICT artifacts are recognized as the linear catalysts of transformation of public sector organizations and structures (West, 2004). ICT diffusion leads to transaction integration, process reengineering, and administrative transformation, toward creating the citizen-centric government (Zhang, Meng, Guo, Yin, & Luo, 2015). Governments' investments in public sector information systems are correlated with organizational transformations designed to enhance the policy effectiveness (Gil-Garcia & Pardo, 2005).

CHALLENGES AND IMPLICATIONS OF ELECTRONIC GOVERNMENT IN THE DIGITAL AGE

The overview of e-government; the adoption of e-government; the digital era governance (DEG) and new public management (NPM); and the significance of e-government in the digital age are described in this article.

Overview of Electronic Government

Electronic government (e-government) refers to the use of ICT tools and applications to enhance the government transparency and accountability in the public administration by improving the public services delivery, access to information, and public governance (Chatfield & Alhujran, 2009). Transparency is recognized as a key value for trustworthy governments (Grimmelikhuijsen, Porumbescu, Hong, & Im, 2013). The scope of transparency is required to be carefully managed for the effective e-government in public sector organizations (Bannister & Connolly, 2011). The characteristics of good public governance include the improved transparency and accountability (Al-Hujran, Al-Debei, Chatfield, & Migdadi, 2015).

The promise of greater government transparency and accountability is the essential perspective for developing countries to take part in the e-government projects (Chen, Jubilado, Capistrano, & Yen, 2015).

E-government projects can be technically complicated, and involve many customers, engineers, and regulatory authorities (Li, 2009). Many governments worldwide are still experiencing the practical problem of the low-level adoption of e-government services by citizens (Rana & Dwivedi, 2015). The e-government adoption-related problem needs the urgent research attention since the success of e-government is highly dependent upon the citizens' adoption and the use of e-government services (Ozkan & Kanat, 2011). One of the main factors of the success of e-government is the development government websites (Rana, Dwivedi, Williams, & Weerakkody, 2015). Most extensive e-government measurements are tailored for the front-end website evaluation from the perspectives of citizens and businesses (Fan & Luo, 2014).

Adoption of Electronic Government

The citizen's adoption of e-government services is an important issue for the success of e-government initiatives (Carter & Belanger, 2005). Prior research classified the e-government adoption literature into two streams (Reddick, 2005). The first stream studies the e-government adoption from the supply-side perspective, which reflects factors that are related to the supplier of public services (Al-Hujran et al., 2015). The supply-side perspective explores the factors that affect the government organizations' adoption and the implementation of e-government services (Li & Feeney, 2014). Examples of these factors concerning supply-side perspective include organizational characteristics (e.g., size, red tape, culture, and top management support), information technology (IT) infrastructure, financial resources, and skilled personnel.

The second stream studies the e-government adoption from the demand-side perspective which focuses on the customers of public services (i.e., citizens) (Al-Hujran et al., 2015). Many scholars have utilized a number of theoretical frameworks to examine the citizens' adoption of e-government services provided by the government (Lin, Fofanah, & Liang, 2011). Examples of these factors concerning demand-side perspective include trust, risk, security, usefulness, attitude, quality, satisfaction, and computer experience. The implementation of digital reforms and the management of e-government programs should be promoted within an effective administrative environment (Stier, 2015). Administrations need the sufficient funding and the qualified staff in order to handle the challenges of digital reforms concerning e-government (Norris & Moon, 2005).

Digital Era Governance and New Public Management

The Internet and the Web 2.0 have revolutionized the public management in advanced industrial countries (Margetts & Dunleavy, 2013). The toolkit for public management reform has shifted away from the new public management (NPM) approach emphasizing fragmentation and competition toward the digital era governance (DEG) perspective, focusing on reintegrating services, providing holistic services for citizens, and implementing digital changes in administration (Margetts & Dunleavy, 2013). NPM reform effectively facilitates the transition of the governance regime from strategic partnership to executive dominance in e-government (Lee, 2012).

NPM and the utilization of complex network structures spanning multiple tiers of government can save governments money (Eggers & Goldsmith, 2008). Handling digital change favorably requires the new macro-theory of public sector development, culture, and characteristic patterns of organizational governance in e-government (Dunleavy, Margetts, Bastow, & Tinkler, 2005).

DEG appearance potentially works with the perspectives of business and civil society changes, within an overall pathway of social modernization that has greatly changed with the development of the Internet and online social processes (Goldfinch & Wallis, 2009).

Significance of Electronic Government in the Digital Age

E-government employs ICT to provide citizens with government-related information about public services (Lee, Chang, & Berry, 2011). Regarding political outcomes, e-government programs can reduce corruption (Bertot, Jaeger, & Grimes, 2010), modernize bureaucracy (Ahn & Bretschneider, 2011), and improve trust in local government (Tolbert & Mossberger, 2006). There is a positive relationship between democracy and e-government (Gulati & Yates, 2011). E-government has been considered as an effective way to increase the citizen's trust in government and improve the citizen's evaluation of government (Wu & Guo, 2015). Democratic politicians often apply e-government to increase their electoral chances by improving the public service provision and by engaging with citizens (Bussell, 2011). Bureaucratic agents can be bypassed by centralizing the parts of their competencies within the national e-government portals, thus restraining the opportunity structures for power misuses (Andersen, 2009).

Public administrations must make a greater effort to implement e-government systems that allow the improved communication with the general public, thus achieving a greater degree of participation (Willoughby, Gomez, & Lozano, 2010). The increasing number of governments are formulating the effective action plans to move service delivery to the Web 2.0, to enhance the government-related information to citizens, and to improve public sector workplaces (Sarantis, Smithson, Charalabidis, & Askounis, 2010). Governments and public bodies have been fostering

the development of e-government services during the last decade, promoting better administrative services through digital channels (Fernández-i-Marín, 2011). In the phase of development of the information society, governments are playing an important role in order to enable the citizens to engage in the different administrative processes in an effective manner (Garcia, Oliva, Belleboni, & de la Cruz, 2011). One of the most important stages of establishment of the information society is the development and implementation of e-government as a system of efficient interaction among government authorities, citizens, and businesses (Zubareva & Byelov, 2015).

Benefits of e-government stem from the relatively low cost and high availability (Kopackova, Michalek, & Cejna, 2010). The outcomes of e-government are related to the adoption of e-government, government capacity, and institutional characteristics (Moon & Norris, 2005). E-government application saves the e-government users' money in the form of faster, easier and more convenient service, better quality and reduced turnaround times, and in some cases a reduction in the direct cost for the e-government services. E-government users can gain the enhanced service levels represented by the improved service quality, reduced turnaround times, improved access to services, and availability of new e-government services.

E-government performance is positively correlated with government effectiveness (Kim, 2007), as it takes a certain level of administrative capabilities to create and maintain the sophisticated e-government framework (Norris & Moon, 2005). As e-government evolves into the transactions stage, governments must grapple with how to encourage the development of e-transactions (Chen & Thurmaier, 2008). The utilization of ICT can facilitate the relationships among citizens, businesses, and government branches (Sun et al., 2015). The benefits of applying ICT in the public sector organizations are concerned with the enhanced transparency, accountability, and trust in

government (Xu, 2012). E-government becomes part of managerial strategies, and promotes the domestic generation of intellectual property (Cook & Horobin, 2006).

FUTURE RESEARCH DIRECTIONS

The classification of the extant literature in the domains of e-government will provide the potential opportunities for future research. E-procurement in the public sector is globally developing in the digital age. E-procurement projects are part of the country's larger e-government efforts to favorably serve its citizens and businesses in the digital economy. E-procurement has various benefits (e.g., cost reduction, process efficiency, spending controls, and compliance) for the public sector organizations. Practitioners and researchers should acknowledge the applicability of a more multidisciplinary approach toward research activities in implementing e-procurement value chain. Cloud computing is the modern pattern of digital computing technology in which virtualized resources are provided as the services over the Internet (Kasemsap, 2015). The adoption of cloud computing in e-government will be the beneficial topic for future research direction.

CONCLUSION

This article highlighted the overview of e-government; the adoption of e-government; the DEG and NPM; and the significance of e-government in the digital age. E-government is the use of ICT to improve the activities of public sector organizations. E-government can open new opportunities for city and local governments to engage in governance by requiring the reforms of underlying working processes. The use of e-government can advance the local democracy by improving the access to information and deepening the citizens' participation in the policy-making process. E-government

offers a path to sustain with the civil society and the private sector to design the effective services and tools to execute the government policies. By improving cities' ability to provide services, achieve policy goals, and increase transparency, e-government encourages the greater trust, participation, and engagement of citizens.

Mastering e-government helps public sector employees and e-government users improve their insights into the systematic e-government systems. E-government enables the efficient provision of services, the enhanced citizen's trust, participation, and ability to participate in the process of governance. The application of ICT to improve the e-government services has been a primary driver for e-government activity. E-government can help accomplish the reform agenda in the public sector organizations. When aligned with modernization goals, implementing e-government can help public administrations focus on the additional changes needed to meet service delivery and good governance concerns. Through citizen engagement, e-government can improve the overall trust relationship between government and public administrations.

The benefits of e-government include the enhanced efficiency, improved services, effective accessibility of public services, and increased accountability in the public sector organizations. However, there are many barriers to using e-government services, such as poor search capabilities, incomplete information, difficulty finding the e-government services via the Internet, and concerns about security and privacy. The major disadvantage concerning e-government is the lack of equality in public access to the Internet, reliability of information on the Web 2.0, and hidden agendas of government groups. Although large amount of money is spent on the development and implementation of e-government, the outcomes and effects of trial Internet-based governments are often difficult to gauge or unsatisfactory. Mastering e-government has the potential to enhance public sector performance and achieve strategic goals in the digital age.

KEY TERMS AND DEFINITIONS

Accountability: The obligation of an individual or organization to account for its activities, accept responsibility for them, and to reveal the results in a transparent manner.

Citizen: The person who is entitled to enjoy all the legal rights and privileges granted by a state to the people comprising its constituency.

Electronic Government: The use of information and communications technology (ICT) to improve the activities of public sector organizations.

Government: The act or process of governing, especially the control and administration of public policy in a political unit.

Information Technology: A broad term that includes the development, installation, and use of anything to do with computing and telecommunications.

Public Sector: The part of the economy that is controlled or funded by the government.

Public Service: The service provided or supported by a government or its agencies.

Transparency: The lack of hidden agendas and conditions, accompanied by the availability of full information required for collaboration, cooperation, and collective decision making.

A Model for Connected E-Government in the Digital Age

Qiuyan Fan

Western Sydney University, Australia

INTRODUCTION

Dawes (2008, p.86) defines e-government as ‘the use of information and communication technologies to support public services, government administration, democratic processes and relationships among citizens, civil society, the private sector and the state.’ In the simplest of terms, e-government refers to electronic government or the use of information and communications technologies (ICTs) in the management and delivery of public information and services at all levels of government agencies (Edmiston, 2003). E-government projects can potentially enhance information sharing, aggregation and reuse, and reducing the costs of back-end office operations. In the digital age, governments are using digital technologies and media to enhance delivered services and public engagement (Reddick and Anthopoulos, 2014).

The UN e-government survey states ‘governments around the world are moving forward in e-government development in an effort to enhance public information and service delivery and to improve the efficiency and productivity of government processes and systems.’ (United Nations, 2008, p.23). One of the emerging changes in structures of governance is the growth of connected governance structures. A connected government model provides an efficient and effective way of conducting government business transactions with citizens and businesses and within governments themselves. For the purposes of this study, the term ‘connected e-government’ means thinking and acting in ways that tie the levels, units, and agencies of government together for common

purposes. These purposes include service to citizens, business and other sectors and support for government operations.

The Australian Commonwealth Government established a new service agenda to adopt a whole of government approach to realising responsive government in its 2006 e-government strategy (AGIMO, 2006). To move forward towards the vision of a connected and responsive government, local government plays a crucial role in key areas of service provision of particular importance to local communities. In fact, community participation at the local level is often higher than at a national level in Australia (Shackleton, Fisher & Dawson, 2006).

The study reviews e-government development at the local level in Australia and proposes a connected e-government model that aims to increase the quality of government services and improve the effectiveness and efficiencies of local government operations. This research attempts to provide a framework for understanding how connected e-government at the local level can help achieve this end.

BACKGROUND

While Australian e-government initiatives have received longstanding international recognition (United Nations, 2008), Australian local government lags behind in terms of showing signs of preparedness to move into the next stage of service provision in comparison with the UK local government initiatives in e-government (Mckeown, Teicher & Dow, 2004). As Sarikas

and Weerakkody pointed out, ‘many local governments are lagging behind the national expectations for e-government implementation due to various political, organisational and technical challenges’ (Sarikas & Weerakkody, 2007, p.155).

As the international research suggests, 80% of citizen to government transactions take place with local, not central government (Socitim & I&DeA, 2002). However, the government websites at the local level are typically not as well developed as those at the federal level. Edmiston (2003) conducts two surveys of 2600 municipal and county governments and finds that although the vast majority of local governments have established Web sites, very little had been done to integrate e-government into their daily affairs because of marketing, privacy and funding barriers.

Local city council’s web sites are a prominent product of e-government initiatives. Although the vast majority of the local councils in Australia maintain web sites and provide a good source of information for citizens, most of the council sites are still relatively basic. The wider benefits of G2B (government to business) and G2C (government to citizen) interactions still remain largely unrealized. The literature indicates that e-government falls short for interactions between government, business and citizens (Reddick, 2009). Few have made substantial progress in integrating e-government into their business processes (Mckeown, Teicher & Dow, 2004). A survey of the state of e-government in the Australian local government sector shows only 6% of e-government initiatives focus on the inter-municipal or inter-governmental activities and more than half of the governance professionals surveyed were unable to identify electronic government activities undertaken in other organisations (The E-governance Team, 2004). The research findings indicate that understanding of the connected government approach in the local government sector remains basic and lacks depths (The E-governance Team, 2004).

A recent research on the e-local government development in the great western Sydney (GWS) region shows that the local governments in the

GWS in Australia have not developed truly sophisticated e-government services (Fan, 2011). The research findings suggest that the majority of the local government websites are primarily informational and they provide one way communication of information from government to citizens and none of those local websites have established full portal capacity through which residents can navigate to needed information and services within governments or across governments (Fan, 2011). The researcher concludes that even the leading councils investigated are less than half way to reach their full online service potential and most of the local councils still have a long way to go to achieve connected government (Fan, 2011). A more recent study on the topic shows that most local governments in the region are using mobile platforms and web 2.0 and social media tools to enhance interactivity, transparency, ubiquitous connectivity and openness of local governments but in general the concept of multichannel e-government and the use of web 2.0 and social media tools to create innovative government services are still in their infancy at the local level (Sun et al 2015)

A FRAMEWORK FOR CONNECTED E-GOVERNMENT

How could e-government evolve from a simple website into a fully integrated one? The existing e-government literature considers e-government development an evolutionary phenomenon and has provided various models of e-government maturity or stage models (Layne & Lee 2001, Moon, 2002). For instance, Layne and Lee (2001) suggest a four-stage growth model for e-government starting with establishing an online presence, moving to interactions, transactions and transformation. These stage models offer the advantage of simplicity and can provide guidance for e-government development. However, Shackleton, Fisher & Dawson (2006) argued that the existing e-government models did not ‘truly

reflect how local governments are implementing successful online web services'. Brown suggests that maturation models play some role but linear e-government progresses sequentially from lower levels to higher ones are less helpful at the local level (Brown, 2007 cited in Dawes, 2008).

Klievink and Janssen (2009) found 'the development and implementation of the final stage of e-government is a major and complex task'. Many local governments do not have the organisational capacity to take the next steps of creating a transaction-enabled citizen-centred e-government. On the other hand, if local government organisations have the resources and capabilities needed to reach the highest growth stage, they do not have to progress through stages of maturity (Klievink & Janssen, 2009). In shifting from a basic e-government to networked e-governance, a more effective e-government development model is clearly required. This research attempts to develop a framework for connected e-government that aims to improve the desired operations that the local government websites are meant to fulfil and efficiency and effectiveness of government operations and to facilitate communication and the coordination

of authorities at different levels of government, within and between organizations. Underlying the concept of connected e-government fits well with a service orientation approach to bring high value information and services to citizens and to improve efficiency and effectiveness of government back end operations. Drawing on the five SOA¹ (service oriented architecture) entry points developed by Carter (2007), the proposed framework identifies the key areas that will need to be addressed by local authorities if they are to harness the full potential of connected e-government.

Connected e-government involves government interaction with citizens (G2C), businesses (G2B), intermediaries and other sectors such as other governments (G2G) and non-government organisations (NGOs). Figure 1 shows the key components of conceptual connected e-government at the local level. It illustrates the key types of stakeholder (suppliers, partners, intermediaries, citizens, businesses and other users as well as employees) interacting with a local council's website through the back-end integration of previously separate systems.

Figure 1. Conceptual connected e-government model

The following sections will discuss the key elements of the framework.

User Centric E-Government Portal

Connected e-government requires a user-centric e-government one stop portal where local authorities are able to bring together previously separate information points and office information. Most local councils in Australia started their e-government initiatives with a focus on providing information and services to the citizens while service delivery platforms remained separate and parallel across various government agencies. Achieving a fully integrated e-government service requires significant reengineering of both front-end and back-end systems and an understanding of associated transformation capabilities and organisational changes.

On the demand side, connected e-government aims to help citizens and other government service recipients to access government information and services more easily. It has become clear that simply putting these traditional government structures online does not meet citizens' expectations. Jaeger and Bertot (2010) state 'It is important for e-government research to focus on the issues of how e-government is meeting the needs of users and the ways in which it is possible to improve user-centred e-government'. It is essential to understand the needs of users of e-government services and resources. In the case of local government, local authorities should engage users in evaluation activities that assess e-government service functionality, usability and accessibility (Editorial, 2006). As Jans and Verdegem point out, e-government will not achieve its goals without a good understanding of the diversity of user groups and their specific needs and capacities of using government online services (Jans & Verdegem, 2006). The user centric e-government portal is best supported through an integrated multichannel approach as there are increasing user demands to access government services from anywhere, anytime through different channels.

Multi-Channel Government Service Delivery and Integration

G

As digital technologies mature, the web portal, mobile and social media channel are becoming main drivers to reach out to a wider user base. Therefore an integrated multichannel approach is essential to greater citizen satisfaction in their interaction with the government in the next stage of e-government development. The importance of multichannel approach to e-government delivery can be illustrated through the view that taking the full advantage of coordinated channels such as web portal, mobile app, mobile portal and social media tools and services will result in government information and services delivery in a cost-efficient and effective manner and a good customer experience (United Nations, 2014). Local governments are aware of the advantages of providing information and services through various channels but generally lack experience and knowledge about implementing social media channels and mobile platforms. The various factors and choices have to be considered carefully while establishing a multichannel approach. One important consideration is to map each digital channel option to meet the needs and expectations of citizens and users. Other factors including cost-effective delivery of e-government services through right channel selection and integration, data security and privacy and management and marketing of the digital channels to reach out to the target user groups should be considered when building a multichannel e-government strategy (Charfield and Alanazi 2015).

The Role of Intermediaries in the Provision of E-Government Services

With increasing levels of government information and services moving online, many local governments do not have organisational capacity needed to interact with citizens and businesses electronically, particularly in areas involving cross government function and complex transactional

services. As Atkinson suggests, 'governments can move beyond engaging with the private sector as e-government vendors and instead empower third party, for profit and non-profit organisations as partners in the provision of e-government services (Atkinson, 2006). However, the potential of intermediaries in the provision of government information and services online has been largely ignored by local authorities despite the fact that they play a key role in e-business and e-commerce.

As shown in Figure 1, G2C third party service integrators have the potential to develop complex online applications to integrate a range of government information and services and to offer transactional based e-government services. Atkinson (2006) argues 'the most cost-effective approach may be to have a third party develop one application rather than have each individual government reinvent the wheel'. On the supply side, the connected e-government model offers an opportunity for governments to reduce time and overhead costs to purchase goods and services as it enables governments to use e-procurement and online group purchasing systems to buy large amounts of goods and services directly from suppliers or a G2B exchange marketplace (Turban et al, 2008). G2B marketplaces are of vital importance as they not only provide an opportunity for local councils to procure supplies at lower prices due to greater pricing transparency and competition but also offer a new channel for suppliers or manufacturers to sell their products. It would be particularly helpful for SMEs who traditionally do not have much chance of doing business with governments.

E-Government Business Process Integration

A one stop portal would require considerable demand for more interdepartmental working within local councils and partnerships between councils and other local agencies. 'A useful way of breaking down the complexity of requirements for a connected e-government system is to con-

sider, in general terms, what government business processes the system must support'. (Jones, et al, 2000) The UN e-government survey identifies a number of business processes required for connected e-government, including:

- The internal operations of an organization that support core processes and are not accessible or visible to the general public.
- Horizontal integration among government departments at same level.
- Vertical integration among local, state and federal government agencies.
- connections among multi-stakeholders (government, private sector, academic institutions, NGOs, and civil society) (United Nations, 2008).

In order to provide a transactional service for businesses or citizens, two or more government organizations need to connect their business processes to allow multiple databases to interact. It is not possible to offer citizens or businesses access to the application, submit information and receive the service without some kind of integration of back-end government systems (Pagano & Cook, 2004). The e-government business process integration not only provides the functionalities, data and shared services needed to enable e-government one-stop portal but also help streamline and improve processes across inter and intra government departments and agencies.

Information Integration

Given that e-government services extend across different organisational boundaries and infrastructures, integrating information and resources stored in these disparate systems is a critical component in the design and implementation of connected e-government (Lakshmi, 2006). Most governments acquire data and information in multiple formats and from multiple sources. 'Integrating and sharing information across traditional government boundaries involves complex interactions among

and with technical and organizational processes' (Pardo, 2007). The key data need to flow between the portal and the back-end systems. The information entered by users on the portal needs to be updated dynamically from back-end database and made available to all other systems within the authority that require the data (Beynon-Davies & Martin, 2004). Information integration offer governments an advantage to share information across systems, across agency boundaries and across levels of government.

To achieve information integration, local authorities need to understand information sources, relationships and business processes and contexts. This understanding can help overcome problems related to the existence of multiple platforms and database, new work processes and organizational changes.

Reusable Services

Governments at all levels have made investments in a variety of systems and developed duplicate functions and services that are available to end-users such as the payment of councils rates and the issuance of a certificate. It is essential to be able to reuse existing services and applications in developing connected e-government. SOA is based on open standards, which makes it possible to create reusable services (Carter, 2007).

The true value of reuse is not only in eliminating duplicate development and maintenances but also supporting standardized services and business processes that can be shared among government agencies and different departments of the government.

Connected IT Architecture

Although connectivity has always been a requirement for e-government, SOA connectivity brings new levels of flexible linkages between government services and throughout IT environment, typically through enterprise service bus (ESB) (Carter, 2007). SOA connectivity creates a highly

connected and interdependent environment where all existing applications and business processes are flowing through existing and new infrastructure without changing them or with minimal rework (Carter, 2007).

FUTURE RESEARCH DIRECTIONS

Further research into connected e-government at the local level is important as local authorities increasingly face the challenge of responding to community demand for more responsive, efficient and effective government. Local governments are also becoming important as an administrative arm for the implementation of federal policy at a local level and the other levels of government are increasingly rely on using the physical and human resources of local government to deliver programs and services for them. Mckeown, Teicher and Dow pointed out that 'Deficiencies in the lack of functionality at the grass-roots level of local government will be a significant impediment to the larger context of aims such as the potential for 'joined-up-government' (Mckeown, Teicher & Dow, 2004). The proposed framework is a conceptual model on which future research might be based. However, empirical study should be carried out to understand the complexity of connected e-government and to increase the success of implementing connected e-government. Further research can help public managers and policy makers shape future direction and identify the capabilities and changes that are needed to realize the full potential of connected e-government.

CONCLUSION

E-government is an opportunity that no government should ignore. Government around the world are moving from basic government online to connected e-government. However, most local governments in Australia appear to be slow to advance their efforts to create functionally connected

and citizen centred web sites. The current state of e-local governments can be best viewed as little more than moving existing public services online. Most of local councils in Australia started their e-government initiatives with a focus on providing information and services to the citizens while service delivery platforms remained separate and parallel across various government agencies. Little of discussion and research work about the next step of connected e-government development in Australia has been focusing on the local level.

A framework for developing more connected and responsive e-government at the local level is of paramount importance. To move forward and develop connected e-government, local councils need to adopt a user-centric focus for the development of e-government services and resources and realise that connected government requires government business process integration and information integration. Reusable services and connected IT architecture are essential characteristics of connected e-government. The proposed framework links to third party efforts (intermediaries), which provides more effective way of developing a more connected e-government by potentially breaking down bureaucratic barriers. The physical and the digital worlds are merging, in business, government, and society. People are becoming accustomed to, and indeed are demanding, instant access to information, to financial transactions, and to government. They are also becoming increasingly accustomed to using a range of transactional channels by means of increasingly portable and mobile devices. No longer are they tied to a desktop computer to conduct online business, whether it is of an official or a social nature. Accordingly, increasingly they are demanding access to local government via the various digital channels. The use of social media and mobile platforms is becoming an increasingly important aspect of e-government and a means of engaging with citizens and delivering improved service. Local governments need to develop an integrated multichannel service delivery approach to connected e-government.

Local governments play an important role in moving forward towards the vision of a connected and responsive e-government. It is crucially important for governments to understand the potential and impact of advanced e-government services at the local level as local authorities increasingly face the challenge of responding to community demand for more responsive, efficient and effective government. This research is significant as it attempts to develop an innovative connected e-government model that aims to enable local governments migrate to a higher level but much empirical research needs to be done to ensure the success of implementation of more connected and responsive e-government at the local level in the future.

KEY TERMS AND DEFINITIONS

Connected E-Government: Thinking and acting in ways that tie the levels, units, and agencies of government together for common purposes including service to citizens, business and other sectors and support for government operations.

E-Government: Electronic government or the use of information and communications technologies (ICTs) in the management and delivery of public information and services at all levels of government agencies.

Local Governments: In Australia (also known as local councils) are established by state and territory governments to handle local community needs.

ENDNOTE

- ¹ The IBM SOA community defines service oriented architecture (SOA) as ‘business-driven IT architectural approach that supports integrating your business as linked, repeatable tasks or services’.

Presidential Elections Web 2.0

INTRODUCTION

An important question for any candidate is, “how does he/she reach potential voters?” One method is through making personal appeals known as the “ground war.” This campaign strategy, in the past, involved both phone calls and house-to-house canvassing. This method had taken a backseat to the “air wars” or using mass media such as television or radio to reach voters. Recently, candidates have started reconsidering the ground war. One reason campaigns are reviving this approach to campaigning is that the electorate has become more polarized. Because the political center is shrinking, it no longer seems logical to make broad appeals to the electorate. Instead, reaching out to the base with targeted messages is becoming a central campaign strategy. For example, until relatively recently modern presidential campaigns had spending 70-75% of their war chest on the “air war.” In 2008, however, the Obama campaign only spent 50% of campaign funds on mass media and instead elected to focus more money on the “ground war” (Hershey, 2013).

The ground war has become easier with the widespread use of cell phone. A Pew Internet & American Life Project Survey (2012) found that during the 2012 presidential campaign, approximately 88% of registered voters own a cell phone and made extensive use of it for political activities. The survey also found that smartphone owners were particularly apt to use their cell phone for political activities including fact checking political statements and taking part in political discussion on social network sites. A recent Pew Research

Center study found almost two-thirds of those surveyed reported owning a smartphone with twenty-three percent of smartphone owners reporting that they used their phone to donate money to a political or charitable cause (2015). The fact that citizens are using their cell phones for activities ranging from fact checking candidate statements in real time to presenting their own personal views on social network sites has not been lost on candidates. During the 2012 election, candidates began adopting a number of strategies that used cell phones to reach the electorate including integrating mobile apps into their campaign strategy for connecting with the public. Finding avenues for reaching out to constituents through mobile apps have continued with the 2016 presidential election. One example is Snapchat, a mobile app that allows for the sharing of photos and videos. Presidential primary hopefuls including Senator Rand Paul (R), Governor Scott Walker (R) and Governor John Kasich (R) each experimented using the app to release campaign ads (Roth, July 30, 2015).

The widespread use of cell phones and an increasingly polarized electorate are two pieces of the puzzle that help explain why candidates are allocating more of their resources to the ground war. The final puzzle piece is social media. When the 2008 Obama campaign was redirecting its resources to more targeted messaging, the Internet was moving from Web 1.0 to Web 2.0 with the development of Facebook (2004), YouTube (2005), and Twitter (2006). Although his use of social media for communicating with potential voters was considered innovative in 2008, it

became common place by the 2012 presidential election. For example, in 2012 President Obama announced his reelection bid with a tweet and a YouTube video while former governor Mitt Romney announced he was forming an exploratory committee by posting it on Facebook, in a tweet and in a video posted on his website. Currently there are a number of narratives coming out of the 2016 presidential primaries. One of the more dominant themes is the importance of social media. This can be attributed, in part, to Donald Trump. While candidates in previous elections used social media as a secondary tool for communicating with the electorate, Donald Trump has been using Twitter as a direct means of communication with voters. Others candidates have followed his lead by increasing the use of social media including Facebook and Twitter as part of their campaign (Lang, April 5, 2016).

What do we know about the effect of these trends on voter turnout? More Americans are now turning to social media for campaign news and smartphones are playing an important role in this phenomenon. These changes in voter behavior have not gone unnoticed by candidates who are adopting “ground war” strategies that utilize the widespread usage on social media and adoption of smartphones. Do the changes in how candidates communicate with the electorate encourage voter turnout? To examine this question, this chapter presents an examination of recent presidential elections and the role social media in mobilize voters.

BACKGROUND

Early researchers (e.g. Davis et al., 2009) predicted that the Internet would change political campaigns in four important ways. The first is through allowing the campaign to transmit information to others. Websites could be used to distribute information that would have previously been distributed through campaign flyers and brochures. This could make it easier for voters to obtain political information. Secondly, the Inter-

net can be used to gather information including background information on opponents. This can help campaign staffers better prepare attack ads against their candidate’s opponents as well as better prepare for attacks directed at their own campaign. The Internet could also increase the ability of the public to interact with the campaign. For example, a candidate can use blogs or social network sites such as Facebook to both communicate with supporters and allow them a means of voicing their opinions. By provided an avenue for voters to interact with a candidate’s campaign and provide input, the campaign can get a better sense of what issues are important to voters and also allow supporters to feel like they are part of the candidate’s team. This could increase loyalty to the candidate. Finally, the Internet might be utilized to mobilize or encourage political participation by citizens. Campaigns could use a number of strategies to encourage participation including sending email and text messages with reminders to register and vote.

Despite these predictions, candidates were slow to include the Internet as part of their overall campaign strategy. The 2004 presidential election was the first to use the Internet in a significant manner for generating online donations, mobilize voters and encourage volunteer efforts. One notable change in election strategy during this period was the advancement of the “ground war”. Because the 2004 election was expected to be highly competitive, both parties worked to get-out-the-vote (GOTV) or contact voters either face-to-face or over the phone. The 2004 presidential election forced campaigns to address a glaring weakness in how they used the Internet. While citizens were now able to obtain political information easier, as well as donate money and volunteer to help campaign, they had chosen to seek out these activities. Campaigns created websites that facilitated these actions but did not use the Internet in a meaningful way to reach out to supporters.

The dynamics of the 2004 election forced campaigns to tap into the potential of the Inter-

net that they had largely ignored. Advances in technology existed allowing parties to combine commercial data sets, Census information and voter registration records to help predict voters, party identifiers and independents that might lean more toward one party or another. This allowed parties to send volunteers into the fields supplied with voter contact information. Aiding in these GOTV efforts was the Help America Vote Act of 2002, which required states to maintain electronic copies of which citizens voted in previous federal elections (Nickerson & Rogers, 2014). The Republican Party made better use of these resources with the creation of a national Republican voter database named *Voter Vault*. They used a series of field experiments during the 2002 congressional elections in devising a 72-hour strategy for the 2004 presidential election. Volunteers and staff members were trained for a final 72-hour push during the election. They went door-to-door in competitive states in a well-organized drive to get voters to the polls. Although the Kerry campaign also had a canvassing effort, it was less organized and primarily conducted by outside groups such as unions (Hershey, 2013).

PRESIDENTIAL CAMPAIGNS AND WEB 2.0

The ground game reemerged as a result of the tightness of the 2004 election and the success of the Republican GOTV effort would make it a blueprint for running future presidential campaigns. Candidates in 2008 focused on the ground war and online donations. The recent development of online social network services would play an important role. Although all of the major candidates had incorporated web-based tools into their election campaign, it was then Senator Barack Obama whose team made the greatest use of online tools. His campaign used Facebook and other social network sites such as Digg, Flickr, LinkedIn and MiGente. It even paid to have billboards placed within popular computer games containing ads for

Obama. In addition, his campaign made extensive use of YouTube to post campaign ads and encouraged supporters to develop and post their own (Bimber, 2014). Campaigns used websites to sign up volunteers and solicit donations. Supporters who supplied their email address also received additional requests for donations, volunteering efforts and reminders to vote. The Obama campaign also collected cell phone numbers from individuals who then received between 5 and 25 messages a month. Facebook was an important avenue for communication between candidates and supporters. It was also a means of expanding its messages to more individuals. Individuals who “liked” a candidate’s Facebook page were asked to forward campaign messages to others on their contact list (Hershey, 2013). Finally, Web 2.0 was instrumental in expanding the ground war. In addition, to using email, social network sites and text-messages to remind voters to turn out, campaigns increased their canvassing efforts.

Rather than waiting until the last few weeks of the election to put in place canvassing efforts, the Obama team set up over 700 field offices to direct canvassing operations. Volunteers and paid staff went door-to-door contacting members of the electorate armed with background information on each person being contacted. This permitted for targeted messages to be used when talking to individual voters. A database constructed by the Obama team was used to determine which households to canvass based on whether they were predicted to be members of his base or swing voters. The McCain campaign had a similar strategy, but it was on a smaller scale. One important development resulting from this ground game was that individuals normally ignored by election campaigns were being contacted and asked to vote (Bimber, 2014). This was an encouraging sign for those who hoped that the Internet could have a positive impact on voter turnout.

With the spread of smartphones, politicians found ways to incorporate smartphones into their campaigns through mobile apps during the 2012 election. Political candidates began using them

for newsletter registration, micro-donation, “a payment or donation a person has charged to their mobile device bill,” and polling (Pessin, 2011). Both presidential candidates, President Barack Obama (D) and former Governor Mitt Romney (R), made smartphone apps available to voters during their campaigns in 2012. Those who downloaded the “Obama for America” app had access to registered Democrats near their address, the dates and locations for Obama-related events, and the ability to donate or volunteer for the campaign. Those who downloaded the “Mitt’s VP” app were promised to be among the first to know who Romney’s vice presidential nominee was. Both apps were free to download for iPhone and Android users (Cline, 2012).

In addition to adding smartphones to their list of online election tools, candidates updated strategies used during the 2008 election. For the Obama campaign that meant improving upon its existing canvassing database. The updated database, *Narwhal*, combined Census data, precinct level data, commercial datasets and information gathered through canvassing, phone calls, etc. (Nickerson & Rogers, 2014). The Romney campaign also created a dataset “*Orca*” to help with GOTV efforts. Both candidates aggressively incorporated social network tools into their campaigns including Facebook, YouTube, Hulu and Twitter. In addition, these tools were used in new ways. For example, the Obama campaign sent supporters lists of their Facebook friends in swing states and asked them to contact these friends and remind them to vote (Bimber, 2014). Despite the efforts of both candidates, voter turnout dropped in 2012. This was due, in part, to lack of enthusiasm by the voters. Because of issues including the economy, voters were not as hopeful as they were in 2008. Another reason is that the candidates adjusted their campaign to target those most likely to turn out. Databases like *Narwhal* can be a double-edged sword. They can be used by candidates to launch more inclusive GOTV drives of the past or can be used to target voters to canvass based on likelihood of volunteering, donating and voting.

In 2012, turnout was expected to be lower and campaigns adjusted their strategy based on their ability to profile voters (Bimber, 2014).

THE 2016 SOCIAL MEDIA ELECTION

During the 2016 presidential primary, candidates including Hillary Clinton, Bernie Sanders, and Donald Trump continued to experiment with strategies developed during the 2008 and 2012 presidential elections including offering free app downloads to Apple and Android smartphone owners. Those who downloaded the Bernie Sanders 2016 app through Apple were able to read news articles, campaign updates, Facebook posts, and tweets in addition to the candidate’s positions on issues. Users could communicate with Sanders through pictures, text messages, voice messages, and video (Group, Inc., 2016a). Hillary Clinton, who did not utilize digital technology to the extent Obama did during the 2008 presidential campaign (Vega, 2015), has now been connecting to her followers through the Hillary Clinton 2016 app which has similar features to the Sanders’ app (Groupe, Inc., 2016b). The Trump 2016 app included similar features along with several others. Those who download this app can donate money, sign up to volunteer for the campaign, and subscribe to push notifications to find out where “the Donald” will next appear and what he is doing. Users can also read Donald Trump quotes of the day and participate in polls to see if the campaign is on track for winning the presidency (Mercer, 2016).

In addition to their extensive use of mobile apps, Hillary Clinton, Bernie Sanders, and Donald Trump have also used Twitter to communicate with supporters. According to the website Statista (2016), Clinton has 6.46 million followers, Sanders 2.36 million followers, and Trump has 8.56 million followers as of May 31, 2016. These candidates have also used tweets to address comments made by opponents and the media. Trump, in particular, has gained attention for his usage of Twitter. He has used it mainly to thank voters in

various states, but has also used it to attack other candidates and journalists. For example, he called Clinton crooked, and criticized Fox News journalist Megyn Kelly after she asked him about comments he had previously made during a presidential debate in August of 2015. He called her a bimbo twice in tweets and stated that he liked her show “The Kelly File” better without her on it (Zaru, 2015; Twitter, 2016).

The 2016 presidential primary has proven to be a paradox. On the one hand, presidential hopefuls have used the 2008 and 2012 as a textbook on how to wage a social media election, albeit with more advanced mobile apps and more widespread cellphone usage. On the other hand, they are using social media in a way that previous campaigns have shied away from. Davis et al. (2009) argued that the Internet would change political campaigns in four ways and until the 2016 presidential primaries it appeared that only three would happen to any great extent. The one prediction that had not materialized was that the Internet would increase the ability of the public to interact with the campaign. While it was argued that using the Internet to increase communication with supporters could lead to greater candidate loyalty, campaigns have been hesitant to take advantage of this capability. It conflicts with the desire to maintain control over the campaign message. Candidates have been using the Internet to mobilize voters in the several presidential cycles but they have been less willing to use its potential to engage citizens (Stromer-Galley, 2014). As a consequence, social media use in previous elections has been underutilized and structured in a manner that limited true interaction. This has changed with Donald Trump’s unprecedented use of Twitter as a campaign tool. Through posting tweets that are controversial, he has been able to dominate the news cycle. Other candidates have altered their social media strategy in order to garner media coverage.

It is still early in the 2016 presidential election. It is not yet known how this change in social media usage will impact turnout in the general election. In

addition, it is not known how the two major parties will work to mobilize voters in November. There are early signs that mobilization strategies might look like the 2008 presidential election. During this election, individuals who were normally ignored by candidates were courted by candidates during the primaries. Two candidates (Bernie Sanders and Donald Trump), in particular, have reached out to unlikely voters in attempts to obtain party nominations. Like other election years, who to target might have been a strategic decision. There has been an anti-establishment mood among voters during this election cycle. Being an outside candidate in a field of establishment hopefuls (particularly during the Republican primaries) may have had a strategic advantage given the public mood. It is still too early to know if this will foreshadow mobilization efforts during the general election.

SOLUTIONS AND RECOMMENDATIONS

Early on there were optimistic predictions that the Internet could increase voter turnout. It was argued that the Internet could be used to mobilize voters. In addition, social media could be used to increase the ability of the public to interact with candidates (Davis et al., 2009). Since the 2004 presidential election, campaigns have been using the Internet to mobilize voters but they have been doing so in a strategic manner. Whether they reach out to a general audience or target likely voters has depended on the dynamics of the election. The 2016 presidential primary is our first example of candidates using social media in more than a secondary tool for interacting with voters and we do not yet know how this change in social media usage will impact turnout. Nevertheless, neither of these campaign activities appears to be the answer for significantly improving voter turnout.

How do we get more voters to the polls? The answer may be in making elections more competitive. Research (Cox & Munger, 1989) finds

that individuals are more likely to feel their vote can impact the election when races are close. Furthermore, close elections are associated with more information and media coverage. Finally, both parties and interest groups tend to increase their GOTV efforts and contact more voters when elections are closer (Key, 1949). This is consistent with the findings from the 2004, 2008 and 2012 elections. The campaigns adjusted their ground game based on expected turnout in the election. To achieve closer elections may require changes in campaign finance laws and rules for redistricting. For example, state legislatures could be replaced with nonpartisan redistricting committees to achieve more balanced voting districts.

FUTURE RESEARCH DIRECTIONS

The focus of this study was the relationship between social media and presidential elections. After several presidential cycles, trends have emerged in how campaigns are taking advantage the widespread adoption of cell phones and social media. Campaigns are using these advances in telecommunication technology to mobilize voters but they are doing so strategically. On the other hand, the 2016 presidential primaries were the first where presidential candidates used social media to interact with voters in more than a superficial manner. It is possible that this may lead to greater turnout in November. Future research should be directed at determining the impact of social media use on voter turnout in the 2016 general election. In addition, research should explore whether social media usage expands in future elections or if the 2016 presidential election is an anomaly. Candidates have been hesitant in previous elections to use social media to interact fully with voters. Depending on how the 2016 presidential election plays out, candidates might try to return social media usage back to the more structured model of earlier election. It is also possible that now that the “genie has been left out of the bottle” they cannot return to the controlled social media usage of previous elections.

CONCLUSION

This chapter began with the question of how has social media changed presidential campaigns. In particular, has social media helped to increase voter turnout? An examination of elections following advances in social media and the widespread adoption of smartphones has shown that they have helped to bring back the “ground war.” Candidates are spending more of their war chest on making personal appeals to the electorate and less on mass media or the “air wars.” At first glance, using the Internet to facilitated GOTV drives appears to hold promise for increasing voter turnout. This was true in 2008; there was an increased voter turnout along with an effort made by campaigns to contact those individuals who are normally overlooked. This was not however the same story for the 2012 presidential election. The election was characterized by less enthusiasm among voters and campaign strategies reflected this. Voters were contacted based on predictions of how likely they were to vote, donate and volunteer. While it is true the ground game can increase voter turnout, the ultimate goal of a campaign is to get its candidate elected. Depending on the dynamics of an election, campaigns may opt for an inclusive ground game or one that is more narrowly targeted.

Although the return to the “ground war” and its influence on voter turnout has been well documented, there are other ways that social media can impact turnout that are less understood. Candidates have historically been slow to incorporate the Internet into their campaigns in part because of fear that it can lead to lose of control over the campaign message. This is particularly true when using social media in a manner that could allow interaction between the candidate and supporters. By allowing supporters to voice their opinions through social media, campaigns may increase voters’ feeling of being a member of the team and increase allegiance to the candidate. Until the 2016 presidential primaries, candidates had structured social media use in a manner that gave an illusion of interaction. True interaction was deemed too risky. This changed as a result of the surprising

success of presidential hopeful Donald Trump during the Republican primaries. This success has been in part because of his strong social media presence. In order to compete, other candidates have left their comfort zones and increasingly taken part in less structured social media use. It is too early to predict the consequences of this new era in social media campaigning. Turnout in the 2016 general election may give us a better sense of whether social media is part of remedy for lagging voter engagement.

KEY TERMS AND DEFINITIONS

Air Wars: Using mass media such as television or radio to reach voters.

Facebook: An online social network service.

Ground War: More personalized strategies for mobilizing voters that includes activities such as door-to-door canvassing and phone calls.

Mobile App: A software application created to run on mobile devices.

Smartphone: A cell phone with advanced capabilities.

Snapchat: A mobile app that allows for the sharing of photos and videos that disappear within a short period of time.

Social Media: Electronic communication sources that allow users to network with friends to share a wide variety of content.

Twitter: A microblogging service.

Project Management in Government

Shauneen Furlong

University of Ottawa, Canada & John Moores Liverpool University, UK

INTRODUCTION

The case for 21st century government success continues unabated; impatient stakeholders are more demanding; people, process, and content are profoundly impacted; opportunity is rampant - but so is risk and complexity; still, transformational eGovernment looks to leadership, integration, change, and innovation through enhanced project management.

Enhanced project management has made progress in advancing eGovernment through a holistic manner so that project activities are fully integrated with on-going operational activities: all with an emphasis on measurable results and outcomes.

This paper builds upon previous publications that there is another dimension to the transformational eGovernment navigation tool-kit that coalesces with enhanced project management and creates a multi-dimensional approach to transformation; it is existential change leadership that focuses on human mindset behaviour along with critical leadership, integration, change, and innovation.

eGovernment, and especially transformational eGovernment, progress remains slow and halting and shackled to time-honoured approaches to project management, especially in the information communication technology (ICT) domain. eGovernment is the traditional, transactional, and service focused improvement on Government operations through the application of ICTs, whereas transformational eGovernment encompasses the reform and modernization of the business process reengineering opportunities and enterprise-wide reform, as well as what and how the government

achieves its mandate. Ineffective project management is one of most significant reasons for transformational eGovernment failure (Aikens, 2012b; Misuraca, 2009).

There are a number of reasons and examples for transformational eGovernment project failures, including the lack of capacity to manage unanticipated transparent and concealed organizational opposition; the inability to effectively and precisely identify current, changing, disparate, and conflicting key information requirements; and lack of insight into the obstacles in obtaining parochially coveted information. These are in addition to a review of literature (developed and developing countries) that outlines the most common issues and problems that cause eGovernment failure to be cultural barriers, infrastructure, resources, socio-economic barriers, security and privacy, and e-integration (Zhao, 2012). Previously, in 2007, a list representing 99 retrospectives in 74 organizations revealed the 36 most common mistakes in information technology (IT) management, with poor estimation/scheduling, ineffective stakeholder management, and insufficient risk and planning leading the list (Nelson, 2007).

Enhanced project management focuses on project integration and change leadership to respond to these mistakes and to specific eGovernment uniqueness because of the broad and disparate goal requirements, the multidimensional and conflicting policy and delivery responsibilities, the dearth of knowledge transfer due to the lack of a “whole of Government” culture, and the complex and competing interest and security concerns of disparate stakeholders (Sarantis, Smithson, Charalabidis, & Askounis, 2010).

BACKGROUND

The eGovernment literature introduces a paradigm that examines the digital government evolution and includes a discussion whether digitization, when applied to internal structures and external relationships, changes them or not (Janowski, 2015). This is critical in determining expectations for change and the degree and impact from the application of technology. This paper builds upon previous research and is concerned with the transformational outcome and thereby attempts to assess the effectiveness of the digitization to transform structures and relationships.

eGovernment studies note that stakeholder disappointment is reported as a root problem that causes many unsuccessful projects (Eslerod, 2016). Other authors and papers as recent as 2016 also state that the management literature falls short in analyzing the impact of project management. Specifically the literature does not make the linkages and connections between stakeholders and the information needed to assist project managers in analyzing and prioritizing the challenges that confront them (Van Offenbeek, 2016).

In addition to this author's research about a compendium of ten eGovernment synergistic challenges and barriers that could be mitigated through enhanced project management, this paper builds upon other research, including the following ten principal challenges concerning eGovernment project management: human resources, work milieu, relations within and across organizational boundaries, project failure impact, goals definition, project dimensions, planning horizon, best practices, legal and regulatory issues, and politics driven nature (Sarantis, Smithson, Charalabidis, & Askounis, 2010).

Internationally, there has been a high and critical failure rate related to IT solutions (Aikins, 2012b; Fraser, 2006). More recently the failure in IT solutions that was the bane of transactional processing is now appearing in eGovernment initiatives (Heeks, 2008; Arif, 2008; Janowski, Estevez, & Ojo, 2007; Aikins, 2012b). eGovern-

ment failures are often hushed up (Heeks, 2008) and as Misuraca (2009) points out, the majority of eGovernment projects are failures as high as 70-80% and are not meeting the breakthrough expectations. Failures are costly; as per Irani, Al-Sebie, & Elliman (2006), the United Kingdom Parliamentary Office of Science and Technology reported that cancelled or over-budgeted eGovernment projects were greater than 1.5 billion British pounds. It is a mistake to automatically link IT investment with fiscal prudence even if eGovernment advocates regularly assert that IT investment in restructuring government programs and practices makes programs more cost-effective and affordable (Longford, 2001).

There are a number of reasons for the lack of transformational eGovernment success, including unanticipated organizational opposition, difficulties in communicating requirements, and obstacles to obtaining information from different government departments and agencies (Kamal, Weerakkody & Irani, 2011). However, there is some support for the belief that one of the most significant reasons for transformational eGovernment failure is ineffective project management (Aikins, 2012b; Misuraca, 2009). The literature refers to the dearth of peer-reviewed information on the effective role of project management, including front-end or early stages of decision making in project management (Samset 2016), and its impact on transformational eGovernment project success even though there are non-peer-reviewed business publications and country audits (British Computer Society, 2004; Fraser, 2006) that identify ineffective project management as an important cause of ICT failure.

The literature review finding is that ineffective project management is a leading cause of eGovernment failure. And the reason for this ineffectiveness is a result of the use of the traditional project management methodologies that do not meet the demands of transformational eGovernment for results, accountability, and problem solving.

This paper supports the importance of project management as a holistic discipline as opposed

to an examination of the specific criteria and iterative approaches used in developing project management methodologies. Project management science is described in the North American focused PMBOK (PMI 2008; PMI 2013) and the European focused PRINCE2 (2009). The fundamental scientific codification sets out project management concepts in terms of project processes and project knowledge areas. By cycling through the processes and knowledge areas, project management spans the full array of information that must be merged to develop an eGovernment project. PMBOK 2013, the 5th edition, describes the process groups to be initiating, planning, executing, monitoring and controlling, and closing. The knowledge areas are integration, scope, time, cost, quality, human resources, communications, risk, stakeholders, and procurement.

There is also abounding evidence that creeping incremental resourcing systems cannot keep pace with the escalating resource demand brought about by radical innovation (Lettice & Thomond, 2008). So enhanced project management must develop more effective processes, techniques, and tools in the key project areas of risk, change, and stakeholder management to reduce the need for increased resource investment in disruptive radical innovation.

The examination of traditional project management methods is also important to address project management effectiveness in today's complex environment. Generally, the project management methodology follows a linear process model (Sommer, Dukovska-Popovska, & Steger-Jensen, 2013) even though this is blamed in product development circles for low performance and market failure. The alternative to a linear model is an integrated approach which is more holistic and includes other domains that involve a high degree of uncertainty, such as project governance, organizational structure, activity dependencies, the need for information exchange, and human resource problems in change impacts.

Managing all of these domains requires working simultaneously and in an integrated way called

the "rugby approach" (Sommer, Dukovska-Popovska, & Steger-Jensen, 2013). Understanding and supporting the project's contribution in fulfilling the organization's mandate - as opposed to merely focusing on meeting the traditional time, budget, and performance goals - is also becoming much more critical (Patanakul & Shenhar, 2012). It has been said that project management methodologies have helped to change the course of world history (Baptista, Santos, & Pascoa, 2016) and the need for constant innovation, creation of new products, and the continuous improvement of production services make it necessary for organizations to work together via the project management lens.

There are many reasons cited for project management failure and many of them are attributed to one or more breakdowns in the traditional project management systems approach (Aikins, 2012c). But when a project finally meets key stakeholder (user) requirements, many other project shortcomings are overlooked such as cost overruns, late schedules, and scope creep. However, in the author's opinion, transformational eGovernment project management must result in success by ensuring that project management evolves from a system activity approach to a system results approach that must meet key stakeholder expectations. This all starts with identifying an interrelated set of transformational eGovernment project barriers, challenges, and change complexities. This paper is focused on enhancing the project management process in order to upgrade the traditional systems activities approach and support the project results orientation.

Of the reasons cited for project management failure, many of them are attributed to one or more breakdowns in the traditional project management systems approach (Aikins, 2012b). Transformational eGovernment project management must result in success by ensuring that project management evolves from a system activity approach to a system results approach that starts with identifying an interrelated set of transformational eGovernment project barriers, challenges, and change requirements. This research is focused on

informationally enhancing the project management process in order to upgrade the traditional systems activities approach and support the project results orientation.

To address the difficulties currently experienced specifically in eGovernment projects, it can be argued that modern project management growth that began in the 1960s (Kerzner, 2001) now needs to be radically accelerated: become less process bound, more results driven, and change oriented.

NEED FOR IMPROVED eGOVERNMENT PROJECT MANAGEMENT METHODOLOGIES

Transformational eGovernment project management has adopted the broad project management components; such as standardized frameworks, governance, certifications, and qualifications that were developed in the past and in different industries. And academics, researchers, and practitioners continue to compile knowledge, skills, tools, and techniques that form the basis of the science of project management. This science has been encoded into project methodologies or guides that are generally accepted by theoreticians and practitioners and they are heavily promoted by government decision-makers and contracting authorities. But most practitioners, and even some academics, perceive and act as though the prime purpose of project management methodologies is to manage administration and compliance rather than support and guidance (Wells, 2012).

In transformational eGovernment, the project management systems approach is not enough. Instead, in transformational eGovernment, project management must discover the interrelated sets of challenges, barriers, and changing conditions that impede transformational eGovernment project success and respond to and cope with them from a “results achieved” perspective. The project management systems approach must become a basic entry level to the transformational eGovernment project management regime. Now, project

results and change management must become the project drivers that are measured by the effective management of objectives, stakeholders, clients, technical and subject matter experts, resources, and functional support services (Kerzner, 2001). Change control is fundamental to good project management (Whyte, 2016).

Managing investment resourcing for disruptive radical change innovation in the project management domain relies heavily on interactive, dynamic project scheduling and monitoring (Jüngen & Kowalczyk, 1995). So in the radical disruptive change arena project planning, execution, and control is searching for frameworks and methods to develop systems that can enhance, or even replace, the human role in resource allocation; activity scheduling; cost and time trade-offs; and analysis of planned and actual delivery discrepancies.

In addition, if examined within a holistic view, there are a number of additional elements that impact project management and eGovernment. Disruptive radical innovation is often cited as the way forward to viable and competitive business, not-for-profit, and government organizational progress - particularly in technological areas (Lettice & Thomond, 2008). However, disruptive radical innovation is accompanied by a significant up-front resource requirement, and it adds management complexity especially when the disruption includes demand for continuous quality in management, processes, and products which impacts the application and design of effective project management methodologies. Adequate resource investment and effective project management are germane to beneficial disruptive innovation and they are considered critical to overcoming management resistance and opposition.

Thus, disruptive radical innovation requires a project management shift in resource allocation models since prevailing resource allocation models inherently mitigate against innovation in such ways as: inappropriate business standards and prioritization approaches, stifling profit margin targets, short-term focuses on existing customers and current technology, distorted incentive

and compensation schemes, and non-sustaining competitive positions (Lettice & Thomond, 2008).

To address the difficulties currently experienced specifically in eGovernment projects, it can be argued that modern project management growth that began in the 1960s (Kerzner, 2001) now needs to be radically accelerated; become less process bound, more results driven, and change oriented. Transformational eGovernment project management could take on the functions and features of other management professions similar to the example of accounting and finance. By comparison, accounting is subsidiary to finance, and project processes are subsidiary to project results. Results should far outweigh processes.

The current more popular international project management methodologies, PRINCE2 and PMBOK, along with a litany of others, do not meet the needs of eGovernment. eGovernment failure is disappointing and much research has been dedicated to examine why and if project management could be the culprit. Clearly, project management plays a significant role. This paper introduces the proposition that current parlance and management culture accepts that the science of project management is only enacted once a project has been identified.

Inexplicably, common practice does not acknowledge that it is the application of the science of project management to any operational endeavour that creates a specific project. The project is born through the application of the project management principles by bringing rigour, discipline, and specificity to a challenging and complex, though often vague, operational endeavour and objective.

In addition, the science of project management expressed through popular methodologies does not address nor assist with the synergistic compendium of ten barriers and challenges to international eGovernment success recently studied (Furlong, 2011; Furlong, 2012, Furlong, 2015) and outlined in the Appendix. And further, the discipline of change management is not one of the knowledge areas in the generally accepted project management methodologies, even though

change management is evolving from an occupation into a true profession and managing projects is developing into a real profession (Silvius & Batenburg, 2009). Change management impacts project management by incorporating a more effective integration framework that is anchored on:

- Developing strategic and operational programs that are based upon a strong linkage among ideas, concepts, action, and feedback;
- Adapting new business processes, subject matter expertise, and support technology;
- Aligning professional project technical skills with broader based management skills in culture, policies, and human resources;
- Ensuring that project management research is focused on the improvement of evidence-based best practices; and
- Exploiting new tools, techniques, and processes that have been well conceived, researched, and tested (Söderlund & Maylor, 2012).

A characteristic of existential change leadership is that the emphasis must be on the human side of the enterprise: people management over task management, and people orientation over task execution. Business transformation is temporary so existential change leadership, the human side of enterprise, solves project problems related to lack of trust in project start-up, untried project experiences and routines, new project organizational role ambiguity, and un-ingrained project commitment (Tyssen, Wald, & Spieth, 2014).

Lastly, one of the key characteristics of existential change management is that it bridges the gap between the more standard project management linear processes and the more amorphous network processes related to disruptive radical project changes. The network processes are able to cope with the creation of a project through progressive collaboration over time as well as instantaneous disruptive innovation. The existential

change management approach includes a flexible project organization structure that develops the needed project processes, tools, and techniques to overcome the misalignment of mainstream project practices with the needs of disruptive innovation and radical change (Robertson, Galliers, Oswick, & Scarbrough, 2011).

In world-wide project management methodologies and other more parochial ones, methodologies and time-honored project management processes associated with project integration, scope, schedule, cost, quality, resource, communications, risk, and procurement are often used as safeguards that split management and control of the projects and thereby water down accountability for project development and implementation success. In no case is there a domain within the methodologies that directly and specifically provides the transformational eGovernment project manager with the tools to cope with the intrinsic problems that impede transformational eGovernment (Furlong, 2011; Furlong, 2012).

The objective of this paper is to revamp project management methodologies by transforming them from process-bound mechanisms to a problem and results oriented instrument. Akin to the early medical profession's emphasis on procedure (e.g., in order to preclude the adage that the operation was a success but the patient died), the project management profession has too long suffered from the use of project management methodologies that focus on procedures and processes instead of those that focus on results and accountability.

Futuristic transformational eGovernment project management methodologies must contribute to the successful management of transformational eGovernment projects. They must move well beyond the generic body of knowledge that is generally recognized as good practice. Instead, the enhanced methodologies must address the very caveat that existing methodologies hedge against; that is, the embracement of the responsibility for management to obtain successful results for transformational eGovernment projects.

The enhanced methodologies must reach above and beyond the goals to provide professional project management certification; standardization of processes, skills, tools, and techniques; and ethical codes of conduct. They must address a higher objective. The required methodology must enhance the science of transformational eGovernment project management so that the project team can be held accountable for results achieved. The project manager and team are not stewards of the administrative procedures; they are responsible for project success and outcomes.

Various key transformational eGovernment organizations (United Nations, 2010; West, 2007) have completed studies that identify the causes of transformational eGovernment project failure and, just as importantly, they have identified, described, and analyzed the reasons for project development and implementation success. Current project management methodologies unwittingly allow the project manager to escape his accountability by retreating behind the mantra: "we're on budget; we're on time; you changed the requirements." These processes protect him at the expense of project results-oriented success as opposed to process-oriented success.

Current transformational eGovernment project management is built on the broad project management components such as standardized frameworks, governance, certifications, and qualifications; and administrative tools and techniques that were developed for a different time and for different industries, some of which no longer exist or are radically changed like agriculture, auto making and mining coal. These project components are focused on the techniques and science of project methodology as opposed to the successful delivery of project products, services, and results; and on the solving of problems and barriers to project success.

For example, current project methodologies related to project cost management involve estimating, budgeting, and controlling costs. But these processes can lead to the creation, control, and

analysis of an array of data points that can overwhelm and even misinform the project manager, the project team, and key project stakeholders. Other project management domains such as project quality management include process elements such as cost benefit analysis, control charts, bench marking, statistical sampling, and flowcharting.

The point is that ineffective project management is one of most significant reasons for transformational eGovernment failure (Aikens, 2012b; Misuraca, 2009), and that the focus on project methodology instead of project results is the root cause of ineffective project management. Methodology trumps results.

Time-honored project management administrative processes such as scope, schedule, cost, quality, resources, communications, risk, and procurement often tend to split the management and control of the projects and dilutes the accountability for project success.

But enhanced project management redirects the definition of projects (particularly ICT work) towards results. It means existing in a futuristic milieu of complexity and uncertainty wherein it is the application of the science of project management to any endeavor that creates a project, not the project start-up definition. Futuristic projects will be created, they will not be defined; they will be created by evolution, unintended consequences, and responsive iteration that solves problems and produces project results. Futuristic projects will encompass a significant component of existential change leadership to cope with the behavior and mind-set uncertainty that permeates projects in an ever-faster changing environment.

In eGovernment project management enhancements, management of eGovernment projects would focus on project problems rather than methodological processes. The enhanced project management solution would provide the tools, techniques, and mind-sets to account for the impact of the holistic, synergistic challenges and barriers that surround and influence eGovernment projects.

SOLUTIONS AND RECOMMENDATIONS

G

In addition to proposing enhancements to project management that include technological support to address the compendium of ten challenges, along with a deliberate intentional focus on results vs. administration, this paper proposes the inclusion of existential leadership to address the human side of the enterprise. The critical aspects of existential change leadership are the content of change, and the decisions and actions that will produce the change results and outcomes, content, people, and process (Anderson & Ackerson Anderson, 2010). And conscious existential change leadership should be tightly linked to enhanced project management to produce a unified, integrated eGovernment transformation strategy. In transformational eGovernment there are well-known challenges and barriers to enhanced project management. But in existential change leadership there are internal and external drivers and resistants that are more subtle, difficult to perceive or understand, and often insidious.

Enhanced project management should become a pragmatic business discipline that is anchored on a strategic, conceptual, theoretical model and an integrated, tactical, and operational management framework. And conscious existential change leadership deals with planned and revolutionary change which is the antithesis of organizational continuity and stabilization. Its discipline is visioning, behaviour changing, and mind-set altering; all of which is based on a set of theoretical principles and a change leadership road map.

Both disciplines center around portfolio agendas; planning and execution processes; standard structures and practices for designing, implementing and monitoring project and change efforts; project and change centres of excellence; subject matter experts; and strategic management offices. Both are equipped with specific proven theoretical and methodological frameworks to

guide practitioners and stakeholders. And both rely heavily on conscious and enlightened leadership to achieve transformational results.

Integration of conscious existential change leadership and enhanced project management is paramount because each discipline brings a specialized perspective to the common essence and key elements of revolutionary change initiatives and transformational project initiatives; they are the common essentials of content, people, and processes. Collaboration, integration and transparency is another growing ingredient in modern enhanced project management that bridges the gap between academic project management perspectives and in-situ project practice; the bridge (gap) is often framed in terms of strategy and execution (Söderlund & Maylor, 2012).

A recommendation for project management integration centers around strategy and execution which is about developing and realizing ideas, business and technology with respect to both product and process, skill sets and attitudes as regards toolsets and people management, research and practice in rigor and relevance, and exploration and exploitation of new and existing knowledge.

It is recommended that the amalgamation of these two disciplines - along with leadership, innovation, change and integration - will effectively respond to the inexorable acceleration demands of transformational eGovernment. Specifically, by overcoming the constraints and risks that have impeded eGovernment progress and by capitalizing on eGovernment opportunities that have remained so elusive.

Enhanced project management will resolve the compendium of ten operational and technical challenges (Appendix); conscious existential change management will address market, business, organizational and cultural imperatives, and leader and employees' mindsets and behaviour.

Transformational eGovernment project management and change management disciplines should include a tactical and operational framework comprised of a project roadmap (Ackerman Anderson & Anderson, 2010) and a set of targeted

compendium of eGovernment challenges and barriers.

The enhanced project management framework remains prescriptive insofar as it recommends activities that should be performed and results that should be achieved; all with a comprehensive specificity and a high level of in-depth exactitude. The basis for this type of framework is that the objective of enhanced project management is predicated on a fully committed project sponsor; defined and articulated stakeholder requirements; multi-level management support; capacity to effectively plan, execute, and monitor project activities; and fully defined project results and outcomes.

FUTURE RESEARCH DIRECTIONS

The objective thus defined enables the integration of the framework, tools and techniques to create the project initiation, a project charter, and a preliminary project scope, schedule, and cost scenario. In this way the project content is defined, an implementation plan is developed, and project assumptions and constraints are determined.

This research has shown that transformational eGovernment is not living up to promises made; progress is stalling and project failure rates are high.

Further research could investigate:

- Why the project management methodologies, originally designed to address the industrial and manufacturing age, do not adequately respond to the needs of today's eGovernment initiatives;
- Why project management seems keen to adopt new factors to achieve success (such as methodologies, tools, knowledge and skills), but continues to measure or judge project management using tried and failed criteria (Atkinson, 1999);
- How methodologies have to be revamped from an administrative compliance methodology to a results-based accountability methodology;

- How project management could be evolved to a state where it can become a critical force in eGovernment solutions;
- How technology could facilitate radical changes to organizational arrangements, reengineered business processes, and become a more client-focused human resource factor; and finally
- How the use of an informationally enhanced project management methodology, along with existential change leadership, could potentially address some of these issues and highlight the need for technological support within the project management discipline.

Thus, the next step in research is to examine a multi-pronged approach, including enhanced project management and existential change leadership to respond to the challenges and barriers that have long impeded transformational eGovernment progress and the accountability vacuum for the elusive transformational breakthrough results.

CONCLUSION

Transformational eGovernment project management must accelerate a more holistic approach in project management. The systems-based approach incorporated in the generic project management methodologies is not enough for transformational eGovernment. Instead, in transformational eGovernment, project management must become more results focused and less prescription focused. It must discover any interrelated and holistic sets of challenges, barriers, and change issues that impede transformational eGovernment project success; it must respond to and cope with them from a “results achieved” perspective. The project management systems approach must devolve to a basic entry level to the transformational eGovernment project management regime, and project results and outcomes must be the project drivers that are measured by the effective management

of objectives, stakeholders, clients, technical and subject matter experts, resources, and functional support services (Kerzner, 2001).

When an organization introduces a change within a project or initiative, that change needs to be effectively managed on both the technical side and the people side. A technical side focus ensures that the change is developed, designed, and delivered effectively. The discipline of enhanced project management provides the structure, processes, and tools to make this happen. A people side focus ensures that the change is embraced, adopted, and utilized by the employees who have to do their jobs differently as a result of the project. The discipline of existential change leadership would provide the structure, processes, and tools to make this happen.

Each discipline addresses the key result areas in its particular domain. Enhanced project management confronts the generic compendium of ten barriers and challenges to transformational projects along with leadership, innovation, change, and integration. Existential change leadership responds to the leadership principles and common mistakes that are endemic to transformational change initiatives.

Enhanced project management and existential change leadership would both aim to increase the likelihood that projects and initiatives deliver the intended results and outcomes. While each discipline can function independently, the most effective approach is to integrate existential change leadership and enhanced project management to create a unified approach to implementing change on the technical front and people side front. The interfaces between project management and change management overlap, and they are certainly interdependent when it comes to successfully delivering value by supporting the strategic initiatives of the business.

Project management is key when it comes to initiating, planning, executing, and monitoring the project activities and deliverables. They ensure a strong solution design backed up with detailed project plans.

Existential change leadership would prepare the organization for the change impact, manage the transition from how we do things today to how they will be done tomorrow, and put special efforts into reinforcing and anchoring the change into the everyday work and life of the organization.

Critical tools in project management are the project charter, business case, budget estimations, work breakdown structure, resource allocations, scheduling, and tracking. Key tools in existential change management are organizational assessments, stakeholder mapping and interventions, communication and coaching plans, training programs, sponsorship road maps, and reinforcement activities.

With the impact of leadership, change, innovation and integration, what remains is the challenge to build an enhanced project management methodology. Accelerating the design of a fully developed enhanced project management approach for the digital age would harmonize both the project and change management disciplines, put results ahead of administration, promote the benefits of innovative change, and deliver eGovernment and ICT project success.

KEY TERMS AND DEFINITIONS

Change Management: Refers to any approach to transitioning individuals, teams, and organizations using methods intended to re-direct the use of resources, business process, budget allocations, or other modes of operation that significantly reshape a company or organization.

eGovernment: The utilization of Information Technology (IT), Information and Communication Technologies (ICTs), and other web-based telecommunication technologies to improve and/or enhance the efficiency and effectiveness of service delivery in the public sector.

Innovation: Defined as a new idea, device, or method. Innovation is the application of better solutions that meet new requirements, unarticulated needs, or existing market needs. The term innovation can be defined as something original and more effective and, as a consequence, new, that breaks into the market or society.

Leadership: A research area and a practical skill encompassing the ability of an individual or organization to lead or guide other individuals, teams, or entire organizations.

Project Management: The discipline of initiating, planning, executing, controlling, and closing the work of a team to achieve specific goals and meet specific success criteria. A project is a temporary endeavor designed to produce a unique product, service, or result with a defined beginning and end (usually time-constrained, and often constrained by funding or deliverables) undertaken to meet unique goals and objectives, typically to bring about beneficial change or added value.

Transformational Government: The use of computer-based information and communications technologies (ICT) to change the way governments

work. The term is commonly used to describe a government reform strategy which attempts to radically change the way people understand government, especially those working within government.

Transformational Leadership: A style of leadership where a leader works with subordinates to identify needed change, creating a vision to guide the change through inspiration, and executing the change in tandem with committed members of a group.

APPENDIX

G

The following summarizes the author's compendium of ten international challenges and barriers that prohibit eGovernment transformation, and offers enhancements to the project management process to address these limitations in an eGovernment environment.

1. *Requirement to manage diverse and conflicting stakeholder interests within a governance framework.* Stakeholder interests are usually conflicting because eGovernment applications are usually developed with one or more departments and central agencies. Each of these departments and agencies has a unique legislative mandate, accountability regime, culture, history and background, and more recently security requirements.
2. *Challenge to continuously adapt to and blend technology, people, and processes.* Today's system environment is more organic than it was in the past; previously, system solutions were applied to a corporate service environment. Today's systems are at the core of company performance, not on the periphery. They are significantly affected by evolving priorities and circumstances, and are more integrated with the operational environment including technological developments, the capacity of the resource experts, and constantly changing and evolving business processes.
3. *Outdated business models that reward traditional applications.* Most business models do not recognize that collaborative and unprecedented solutions do not meet the criteria for performance measurement targets, accurate costing and resource utilization, and work plan deliverables whose solutions are not known until they are negotiated and well into the implementation stage. Promises of cost and resource reductions along with improved efficiency and effectiveness gains the funder's attention more than promises of transformation and innovation.
4. *System development models affected by political realities and a new relationship with the private sector.* Most system development models do not recognize the "stop and start" reality of projects affected by political cycles and funding priorities, and the need for system development fragments to be reused instead of continuously "starting over." Though cancelling projects is generally due to changing systems objectives, it is critical to recognize the waste of precious resources and time, and the inability to recover and reuse these efforts. However, public service has been impacted significantly through private sector contracting and outsourcing arrangements. The integration of private and public sector resources is now mandatory.
5. *Lack of access to lessons learned and a body of knowledge for government wide projects.* Project managers are designing and implementing system solutions that are often unprecedented and government wide, and yet they have no facility to access the knowledge nor benefit from the experience gained from other project managers in similar circumstances. The problem is that there is no way to harness previous experience and no demand to conduct and access lessons learned.
6. *Promises of interoperability, integration, and cost and resource savings.* The eGovernment environment is predicated upon a collaborative and partnership-based environment that requires sharing both work and accountability responsibilities, and it is usually argued (and ultimately funded) under a banner of promised cost savings and resource reductions.
7. *Proliferation of information and the challenge to judiciously access and manage information.* The information age exacerbates project management because of the massive and exponentially produced data that must be sorted out to effectively implement system solutions. The interconnectedness of information and system requirements is so overwhelming that projects suffer from the weight of information. Mining through this data to retrieve the relevant information produces a "spin and

churn” that can be non-productive; and this, along with the lack of authoritative control to wind through the layers of information, can derail the project.

8. *Lack of a comprehensive holistic approach to project management as the driving force.* Project management often plays the role of arbitrator, as it is often the agent that brings the disparate parties together to deliver a solution that was not driven by either party. This is usually the case with citizen centric applications as they cross the program interests of each of the contributing organizations. Project management needs to drive the solution to change the business processes of the affected departments and turn the solution into a government wide enterprise.
9. *Limited access to vital subject matter expertise.* Within governments, knowledge is either so vastly spread or not available that it is difficult for the project manager to understand the implications of systems design. The knowledgeable personnel are difficult to locate and approach given hierarchical and organizational limitations, and are frequently reassigned and no longer accessible.
10. *Organizational environment not presupposed to enterprise-wide transformation.* Departments do not necessarily act as units of a government enterprise; they are vertically based with individual objectives and resource reward mechanisms. Accountability of each department is to its Minister and senior officials, and to the government acts for which it was created.

Technology and Terror

Maximiliano Emanuel Korstanje
University of Palermo, Argentina

Geoffrey Skoll
SUNY at Buffalo, USA

INTRODUCTION

Our founding parents envisaged a world where progress, rationality, and technology played a vital role in building a better place to live. They never imagined the effects of 9/11 nor the financial market and stock crisis in 2008. The rise of uncertainty as a main cultural value of contemporary society raised the question of how much technology facilitated the evolution towards a more pacific, fairer, and safer world. We have witnessed how 9/11 strengthened a process of securitization where high technology was used to surveille citizens, accompanied by ethical dilemmas as illustrated by the Edward Snowden case. David Lyon (2003) points to the public spaces of airports, city squares, and restaurants which are monitored by digital cameras and biometric technology. Securitization has reinforced authorities' trust in technology while terrorist attacks continue across the globe. Maximiliano Korstanje (2014) has argued that English-speaking cultures and technology were inevitably entwined. Technology facilitates prediction of events in the future, and thereby encouraged an excess of trust in technological solutions to social conflicts and problems. This is why the concept of risk is an essential element of Anglo culture (Korstanje 2014; 2015): namely its association with capitalism and the desire to predict outcomes to assure profitability. Much of the connection between technology and English society goes back to the creation of modern science by Issac Newton (1643-1727), which coincided with Britain's leadership in capitalist development and global imperialism.

The advent of terrorism as justification of states' social control and growth of repressive apparatuses has led to ethical dilemmas in purported democracies. After Edward Snowden's revelations, citizens understood the limits of democracy as well as the darkest side of state terrorism. The rational nation state, far from enhancing the well-being of its citizens, manipulates the fear instilled by terrorism to increase social control and subordinate private life to the government. This chapter explores ethical issues of electronic surveillance, which is ostensibly applied to thwart terrorism, but which has the effect of undermining democracy in the United States and the developed world. The main thesis is that the apparent conflict of security versus surveillance is what keeps terrorism alive. In the first section, we discuss how the use of electronic cybernetics produces a dissociation between morality and action. This leads to question to what extent digital technology can prevent disasters. In the twentieth and twenty-first centuries, if not before, science has been instrumentalized to protect the interests of the status quo and to try to control the market. Instead of understanding facts as they are or save lives, science became employed and deployed to reducing risks and losses of wealth. The excess of information produced by capitalism obscures reality for decision makers, and contributes to a permanent state of emergency (Mueller and Stewart 2016).

Robert Boguslaw (1965) noted rise of a new utopian class, composed of aficionados of technology and high-tech design. This technophilia fed the maximization of profits over ethics. Today's

DOI: 10.4018/978-1-5225-2255-3.ch316

alienation, he said, derives from the powerlessness to accept probability as a mainstream cultural value for society. He opined that reliance on technology increasingly promotes a moral indifference so long as their behavior coincides with profitability. Decades later, Jean Baudrillard and Paul Virilio made similar arguments.

For Baudrillard, technology plays a crucial role in configuring a hypothetical scenario rooted in the future, but with disciplinary practices. He argued that this state of affairs was accelerated by 9/11, which promoted a parallel reality where pseudo-events prevail. Baudrillard referred to Steven Spielberg's movie, *Minority Report*, as depicting his thesis about the convergence of the future with the present. In the movie certain people are clairvoyant about future crimes, thereby allowing for neutralizing criminals before they can commit offenses. The movie raises the question of how a crime can be punished before its commission. Baudrillard points to the War on Terror and US counter-terrorism strategies as using similar methods, but which in reality legitimate US geopolitical control of the World. As Baudrillard construes current policies, fear paves the way toward increasing paranoia which is a product of the multiplication of information and the hegemony of object-sign (Baudrillard, 2006).

In Baudrillard's view, the 9/11 attacks represented the clash of triumphant globalization at war with itself and unfolded a fourth world war: the first put an end to European Supremacy and to the era of colonialism; the second put an end to Nazism; and the third to Communism. Each one brought us progressively closer to the single world order of today, which is now nearing its end, everywhere opposed, everywhere grappling with hostile forces. This is a war of fractal complexity, waged worldwide against rebellious singularities that, in the manner of antibodies, mount a resistance in every cell. (Kellner, 2005: 3)

For his part, Paul Virilio warned about the dictatorship of virtuality as a new mechanism of

generating commitment and exclusion. He agrees that by means of the imposition of stereotypes mass media moulds citizenship. Public opinion is shaped according to economic interests of informational chains controlled by owners of media. They are able to link disconnected events in any part of the world, which are then disseminated to global audiences in minutes. One result is the diminution and devalorizing of human face to face communication and interaction. Consequently, the distinction between what is or is not real is decoupled from being there and social agreement, a point noted by many in the field of social psychology. Sharing similar norms, people construct symbolic archetypes which together make up a social imaginary. In contrast, Mass-mediated interaction short circuits this social process, creating a dictatorship of oculo-centrism: a signification of the image wherein the interpretations of images are standardized according to the dictates of the media. This mediated tele-interaction reduces the independence of citizens for comprehending their environment (Virilio, 1996). As Nicholas Carr (2011) says, the possibility digital technology is making us more stupid than other generations. The excess of stimulation and the velocity digital narratives to gather and read information undermines the possibility of understanding what is being processed. This means that we handle more information but with lessened capacity to understand events. As we will discuss in next section, technology seems not to be part of solution, but the problem.

BACKGROUND

From Disasters to Terrorism

Ulrich Beck's (2006) popularization of risk analysis put forth the argument that accidents under some conditions were the result of an inadequate manipulation of technology. Using the Chernobyl nuclear meltdown as exemplar, Beck argued that humanity had entered a new era in which tech-

nological advance surpassed threats from nature. According to Beck it is the shift from natural to technological threats that marks post-modernity. Despite, or maybe because of, Beck's a-historicism and anti-Marxian sociology, the popularity of his work reflects a recent recognition of threats that arise from new technologies developed in the latter half of the twentieth century. Although, technological advances are aimed at making this world a safer place by mitigating and controlling risk, the fact is that they contribute to creating new risks. Of course this is not new. For example, at the turn of the twentieth century growing horse manure in urban areas presented a major public health hazard, until internal combustion engines replaced horsepower, which then led to air pollution from burning fossil fuel. Ecological concerns are perhaps a point where the paradox of technology is most vividly appreciated.

The goal of this chapter aims at exploring the connection between technology and risk. In doing so, the discussion between Cass Sunstein and Anthony Giddens illustrates what might be called the establishment framing of the argument. Sunstein has been part of US President Obama's cabinet, and Giddens helped construct the third way program of Tony Blair and New Labour in Britain. While Sunstein argues that fears are determined by cognitive shortcuts, Giddens says that risk seems to be a result of technology. Giddens questions confidence in technology, although he praises its benefits. Sunstein is convinced that risk is a product of human ignorance and inaccuracy in the decision making. Two views, two alternatives are juxtaposed in an ongoing debate.

The Sunstein-Giddens debate draws the boundaries of policy analysis within a world capitalist framework. That is, their debate stays safely within the ethos and assumptions of the currently prevailing political economic system that dominates the globe. Sunstein is a legal scholar and professor in the Law School the University of Chicago. He is part of the clique there that adheres to the so-called law and economics framework derived from the Chicago School of Economics. This Chicago

School has been led by such world luminaries as Gary Becker, Milton Friedman, and others whose ideas owe much to the Austrian school of Frederick Hayek. They are anti-Marxist, anti-Keynesian, and avowedly neoclassical. In practice their ideas formed the basis for the neoliberalism of Western hegemony in the late twentieth century. A hallmark of their thought and its legal and public policy applications is the central figure of the rational actor. The rational actor is a heuristic to allow various econometric formulae to have some reference to the real world. The rational actor is the *homo economicus* who always acts to ensure the greatest economic advantage to him or herself as an individual. All theories flow from this assumption which is markedly individualistic and assumes a kind of cognitive functioning rarely if ever found among real people.

Anthony Giddens takes a social analytic approach that is neither individualistic nor based on the assumption of blind social forces and structures that operate without human agency. Giddens' approach combines individual agency with social structure. He does not assume a rational actor, but sees a dialectic between the effects of socialization (social structures, institutions, and the like) and the ways people act. Most relevant to the Sunstein-Giddens debate and the present essay is that Giddens says that technology is both a consequence and cause of human behaviour as they shape each other. Their debate comes down to one between the neoliberals and the Keynesian. It ignores the far more far reaching and radical critiques offered by a number of authors reviewed in this article.

In what follows a number of analysts are reviewed. None is directly involved in the Sunstein-Giddens debate. Nonetheless, each analyst presents a different aspect of technological evolution, its consequences, and its relationship to human behaviour and decision making. Technology plays a pivotal role in organizing not only behaviour but also the society itself. Undoubtedly, the technical advances blurred the connection between time and space, facilitating many things for people. Among

the benefits of technology applied to health for example, we have:

- Lights and electricity created a real revolution in temporal-spatial displacements.
- Life expectancy has been extended.
- The techniques of education have been radically altered providing new resources.
- Risk, disasters, and other dangers may be mitigated by means of technology.

G. Amar (2011) argues that the evolution of technology has made life safer in many senses. The current meaning of mobility seems to be something else than a technique. This exhibits a spirit and kind of social bond that connects self with territory. Technology may be not only positive, but allows re-discovering the principle of “religance”. This neologism refers to the anthropological sense of place. The principle of religance that circumscribes the subject to the community may create new technologies, more sustainable for ecology that improves our quality of life. From this perspective, Amar argues that innovation would play a pivotal role in the industry of mobility worldwide. In contrast to the prevailing French literature, Amar is convinced that there are two ways of moving. If we evaluate the problem of mobility in terms of space-time criterion, we need to conclude that technology has made life faster, but not safer. Rather, Amar adds, there is surfacing a new manner of transport, where people are experiencing the “time-substance” to fabricate sentiment about visited spaces. This new type of mobility follows recreational goals determining long-standing and satisfactory experiences (Amar, 2011).

Technology can serve as a mechanism of mitigating, forecasting, and preventing disasters. In opposition to this, Paul Virilio (1996) says that technology acquires a negative tendency because it expands not only the process of alienation but blurs the boundaries of heritage and nationhood. He notes that mass media is framing and controlling the sense of reality. Today it is in vain to question the veracity of news, what is important

for an audience is hyper-reality. Human perception now can see only events that never have happened; they are rooted in the future. Showing a natural tendency to communicate with others, human beings adapt their behaviour to specific environs. Events that are geographically dispersed are broadcast on the same screen synchronized in seconds. The acceleration of mobility triggered an inevitable confusion between present and future. As a result of this, technology leads to a decline of trust and social bonds. Unlike Amar, Virilio thinks the technology eliminates the natural barriers that prevent risks. Before the twentieth century, cities were built as refuges that marked the ends and beginnings of civilization. Whatever else its nature, the city was bounded by the wall, but in the digital world, where all cities are cloned and globalized, any event may trigger a real disaster (Virilio, 2007; 2010).

In his study of the new social self, *One Dimensional Man*, first published 1964, Herbert Marcuse argued that technological societies are irretrievably flawed. At the same time that technology advances, liberty is being sacrificed. The dependency of human beings on the newest technique not only paves the way for the advent of a new ideology, but also depersonalizes the workers in favour of capital (Marcuse, 1991). Marcuse’s criticism echoed that of Aldous Huxley, whose 1931 *Brave New World* depicted a fictional dystopia where people are controlled by various technologies, chiefly genetic manipulation. In this valuable novel, Huxley introduces readers to a discussion where society is defined as a set of embodiments based on abstract ideas. This novel represents an acid criticism of a technologically determined world and overpopulation. Given the demographic decontrol in urban areas, Huxley envisaged that technology would be efficient in controlling human beings as machines. As a result of this, democracies would be converted to governments bound to totalitarianism (Huxley, 2006).

In this respect, Darin Barney presents a model to understand the role of technology and its effects on democracy and political life. He says that

although technology leads humankind beyond ethical questions, it is important not to lose sight of the fact that it should be defined as a political construction, whose ends are based on imposing a specific discussion (Barney, 2007). The problem of technology is that any question is answered before being formulated. Proponents of technology have criticized this view by saying it transcends the boundaries of culture and ethnocentrism. Technology in a globalized world permits changes, and different postures directly to a species of trans-humanism. This would entail a more democratic and fairer society (Hughes, 2004). In this vein, the British journalist Guy Sorman admits that risk detractors are more interested in preserving the status quo than in exploring the benefits of development. Technology for Sorman is not only positive, but also emancipatory from many points of view. Enemies of technology are reluctant to progress. In lieu of accepting this, they prefer to confuse public opinion by inventing risks that do not exist (Sorman, 2002). Generally, academics have agreed that given some circumstances, technology may engender some risks, which if not duly evaluated, lead to future states of emergency. Of this point, likely, Chernobyl is one of the most vivid examples. Next, we will consider to what extent reflection and knowledge generate panic in public opinion. The sentiment of panic paralyzes the natural barriers to strategic risk management. Unless otherwise resolved, minor risk creates serious disasters by its cascade effects.

Technology in Knowledge-Oriented Societies

A historiography of evolution of science merits deepening the question of technology. Although many historical waves of critics have discussed the issue, A. Cuevas distinguishes three important schools: a) the hierarchal model proposed by econometrics, b) non-hierarchal models proposed by sociology, and c) a mixture of agent and system recently developed by the theorists of complexity. While each stage is characterized by focusing on

the diverse forces technology exerts on human behaviour, the fact is that the connection between technology and science depends on its application. Technology is based on two significant elements: artefacts and techniques (Cuevas, 2005). To expand the current understanding of the issue it is important to conduct interdisciplinary research. Every discipline develops a particular definition of technology. It is important to remember that those groups whose access to the monopoly of technique have a substantial advantage that allows them to dominate others who are relegated to the currently prevailing technology. The problem is that technologies may be harmful whenever they do not support common well-being. More often than not, imposition of new technologies risks a Huxleyan style dystopia. Steven Benko admits that technology is being accepted as a way of rationalizing the altering of conditions of existence for humankind. He argues that it may be used in gaining more knowledge but it should be accompanied by ethics to achieve some commonly shared goals. Therefore, social science should focus on the evolution of the ethic of technology in lieu of the technology of science (Benko, 2005). The understanding of the possibilities or hazards of technological revolutions depends on the ethics of technologies' application. In this vein, M. Scott Ruse replies that it is one thing to use technology in the accompaniment of human evolution, and quite another to confront what he calls hegemony of techno-humankind that has accelerated after the advent of post-modernity. The misuses of technology are determined by political goals, or social pathologies. What is important to remember here is the connection between technology, risk, and mobility. Ruse argues that technological revolution needs philosophical scrutiny because the nature of man is at stake. The state, the economy, and the ontological perception of the world penetrate by means of technology. However, in recent centuries the global trends show a hegemony that transformed technology into a totalitarian force. The resulting alienation is counter-productive for societies as it virtualizes space to become the

primary human habitat in a great air-conditioned system. James Farris notes that regardless of the technology, people ultimately have to recognize their groundedness in the everyday and their connection with the material realities of earth.

The extension of technology into the infinite reaches of cyberspace is both exhilarating and wondrously productive in advancing the reach of intellectual and technical power. The accompanying dilemmas and ethical questions are bound to relate back to practical terms of our existence on planet Earth. Our interventions in the sphere of ecology are a critical test of our integrity. The simple action of sorting out the household garbage can remind us of the chain of being extending along our technological story. (Farris 2005: 7)

Virilio anticipated the problem when he cautioned in his *University of Disaster*, that advances in technologies of communication and transportation have created new forms of displacement in time and space. Today people have access to any geographical point of this planet in hours. The time of waiting or travelling has changed forever. Travellers can now move with little genuine contact in the visited lands. Global transportation and communication technologies have made a new kind of real time in which synchronization of watches is neither necessary nor relevant. In addition, citizens have been transformed into consumers. History has been emptied into a fragmentation of events, dispersed globally, and broadcast repeatedly. The attack on New York's World Trade towers in 2011 remains the iconic case in point (Virilio, 2010).

Turning to the generation of knowledge, Virilio says that what had characterized the labour of the university has been dispersed to delocalized territories. Based on an ongoing future that never makes room for the presentiment of disaster, knowledge announces the eschatology of neurosis. In plain words, Virilio argues that everything happens at the same time in hyper-reality without a logical sequence. The world stage is represented

outside the planet, in an exo-earth. The notion of science, as an all encompassing instrument based on rational understanding, has changed. It has turned into an exo-science that promotes the simultaneous globalization of fear, whilst biology and astronomy are eclipsed by the eternal present. Virilio emphasizes the mea culpa of science for its failure to create an ethic of life. Based on the belief that global warming is not reversible in the short run, science explores issues from the perspective of homeland security understood as capital maximization. Big corporations, banks, and the capitalist elite call on climatologists and geographers to design catastrophe simulation software that provides some information about where the next disaster will hit. As Naomi Klein (2007) points out, much money can be made by predicting the next disaster. A new profession is rising: the "economic-disaster-modelling-geek". This expert seems to be more interested in finding and eliminating the risks to businesses, or finding ways to profit from such risks, than in protecting the environment. The philosophy of the science is today determined by the logic of digital screens. The simulation of future that characterizes the digital world has replaced the daily life (Virilio, 2010).

The Excesses of Technology

Zygmunt Bauman has emphasized the hedonist consumption that leads modernity. With a different approach, Anthony Giddens examines the experts who frame and deal with risks. Unlike other times, today's consumers are familiar with the product they buy but this point is secondary as that knowledge is suffering from a process of reflexivity. What characterizes social life in late modernity seems to be the complexity of capitalism that re-structures the connection of institutions along with their individual actors. Where pre-modern societies saw in witchcraft a valid instrument to predict the future, the science of actuary or risk statistics not only validates the policies of the state,

but also represents reality for civil society. “[M]odernity’s reflexivity refers to the susceptibility of most aspects of social activity, and material relation with nature, to chronic revision in the light of a new information or knowledge. Such information or knowledge is not incidental to modern institutions, but constitutive of them ... because many possibilities of reflection about reflexivity exist in modern social conditions” (Giddens, 1991: 20). Modern reflexivity has the capacity to create many realities depending on the purchasing power of consumers.

In a recent book dedicated to ecology, Giddens acknowledges that technology could make a better world, but this does not happen. Instead, technology creates threats to public health. While some risks are monitored and controlled, other, more globalized ones, work as a runaway train (Giddens, 2011). It is important to mention that accidents, like runaway trains, are based on randomness. Accidents could have been other things. Although capitalism has constructed a rational basis of control over almost all human interactions, the fact is that its immanent contradictions lead to the collapse of the whole system. Contingency, uncertainty, and randomness permeate the world system of capitalism. Charles Perrow (1999) uses a risk analysis approach used by insurance companies. He says that the timing of actual accidents is based on the sad reality that a similar event could be repeated at least six times. We are daily facing serious, imperceptible risks that randomly do not materialize in an accident. The circles of control tend to be petrified so as not to monitor these minor risks, which sooner or later cause the disaster (Perrow, 1999). The technical perspective not only ignores this reality but also thinks, erroneously, that risk may be controlled by technological machinery. Risk analysis is central not just to the insurance industry. It lies at the very heart of capitalism. It is the foundation of cost-benefit analysis which is merely a way to calculate whether an endeavour is worthy of

investment, whether expected returns are worth the amount of capital risked.

Robert Castel (2006) examines how individual liberties were tied to private property. Based on the hegemony of capital, modern societies regarded safety as a mechanism to reduce the impacts of illness, poverty, disasters, and aging. Modernity brought a degree of social well-being. At the same time, security gained through technological advance in industrialized societies corresponds with an inflation of perceived risk. Paradoxically, far from feeling more secure, people are frightened by the new, such as scientific reports that discover new causes of cancer. Castel identifies the feeling of insecurity as an obsession with protection. This collective risk aversion corresponds with individualism, atomization, and decreasing dependence on traditional social bonds. Towns and cities were protected in medieval times by the symbolic hegemony of the Catholic Church, but with the growth of market-based relations, secularization replaced religious subordination bringing with it more autonomy. In effect, the transition to modernity resulted in more autonomy but less security, something belaboured by the social theorists of the late nineteenth and early twentieth century—from Emile Durkheim, to Georg Simmel, Ferdinand Tönnies, and Max Weber. The vulnerability of citizenry, as it is conceived today, comes with the decline of feudalism and its replacement by industrial capitalism. In preindustrial times, the degree of violence and hazards of disease in daily life led to low life expectancy. With modernity, people experienced notable increased longevity but concomitant with weaker social bonds. Kai Erikson (1994) reminds us that risks not only derive from the decline of trust, but by the excess of technology whenever protocols of operation are not regulated. The theory of complexity raises the levels of uncertainty in systems and thereby exponentially increases the need for cybernetic controls. The more complex the system, the more regulation is needed to maintain the system, and therefore the more need for cybernetics.

Terrorism and the Problem of Surveillance

The attacks of 9/11 shocked the world. The use of civilian aircraft as weapons combined with the targets—Wall Street, the Pentagon, and a third target that might have been either the White House or the Capitol in Washington DC seemed unimaginable. The Tourism industry, which had been a major symbolic expression of Western supremacy, plummeted. The denominated perpetrators, presumably nineteen jihadists, seemingly planned the attacks according to the rational steps of a management guidebook, or so the story cooked up by US authorities portrayed the incident. From that moment on, Western governments construed terrorism as a global threat which emanated from the Muslim world, especially that part of it with vast oil deposits (Sandlers & Enders, 2004; Steiner & Al-Hamarneh; Korstanje & Clayton 2012; Korstanje, Tzanelli & Clayton, 2014; Tarlow 2014). The effects of terrorism on tourism industry went from the suspension of many flights and the rise of unemployment to deployment of technological boondoggles like full body scanners at US airports. Henceforth, nobody can feel safe anywhere (Korstanje 2015). The so-called scourge of terrorism brought forth a phony debate that counter posed individual freedoms and public security. Individual rights were legally abrogated amidst a massive deployment of communication technology to spy on Americans and other citizens in the Western World. WikiLeaks and Snowden's revelations showed citizens that their governments used terrorism and security issues to curtail any semblance of privacy and democracy (Altheide 2014; Skoll 2014).

David Lyon and Zygmunt Bauman (2013) note that 9/11 did not create the logic of liquid surveillance; it accelerated the conditions of its reproduction. Employing the term *adiahorization*, as dissociation between action and ethic fields, Bauman adds that the introduction of technology originally was aimed at mitigating some major risks. However, it has paved the way for ethically

devoid policies and practices. Counter-terror violence increasingly became controlled by machines, digital instruments manipulated by automatons. Any error, any mistake at time of calculating an attack, was labelled as collateral damages. In this vein, Bauman and Lyon cite what Hannah Arendt wrote in her report on the trial of Adolph Eichmann (1963) that she called the banality of evil, which is the bureaucratization of instrumental reason. The main thesis of Lyon and Bauman's *Liquid Surveillance: A Conversation* (2013) is that modern polities have adopted surveillance technologies for two reasons. First, they are used to control undesired guests, a sort of extended passport control system. Secondly, they ostensibly protect the citizens of the polity. Undesired guests, those who cannot pay for the amenities of the polity are marked and pushed to the peripheries of the city. Think here of the banlieues of Paris or the favelas of Rio de Janeiro. Lyon and Bauman imply a weakening of the state as its primary role has become facilitation of global commerce, or globalization. By introducing surveillance technology state control apparatuses try to mitigate citizens' exposure to threats made possible by globalized commerce, communication, and travel, whether from infectious diseases, globe-trotting terrorists, or transnational organized crime. The quest for order that characterizes the human existence is mitigated by the need for change.

In this respect, Rebecca Fiske (2016) uses the notion of the state of exception as expostulated by Carl Schmitt (1985) and critiqued by Giorgio Agamben (2005). Fiske starts with the premise that law originated from the authority of divinity, which intervenes in human affairs at the moment of moral emergencies. Schmitt's concept of sovereignty is that of a gatekeeper. The state of exception opens the doors for paradoxical situations. Fiske notes that after 9/11 the United States violated the human rights of its citizen in the name of security and well-being—to say nothing of its war crimes and crimes against humanity in foreign land. The “global terrorist became an internal and external threat, and the war on terror became so complex

and pervasive that the definition of an immediate threat originating outside the border changed considerably” (Fiske 2016: 11). The challenge to what was left of democratic institutions in the United States rationalized by 9/11 was excused by positing the false dichotomy between liberty and security as addressed by Hartzel and Gerde (2016). The proposition that security demands obedience leads to conditions under which information presumably garnered to protect people is used to control and oppress them. The Nazi Gestapo operated on the same principle.

The Excess of Information

The intersection of terrorism and the digital media was assessed in a book edited by Mahmoud Eid (2014). Introducing the term, ‘terroredia’, Eid expresses the connection between terrorism and media coverage. Many terrorists are fluent in English, the global hegemonic language, and can disseminate their messages to world-wide audiences, and they are able to use digital technologies such as websites, Facebook and other social networks. Eid’s edited volume explores the mutual dependency of terrorism and media. In one of the chapters Samuel Winch comments on the use of media by the ruling class for domestic control and international influence.

In terms of media coverage of protest movements, we could expect ruling class interests to include maintaining the status quo, and therefore, efforts to marginalize dissent and dissenters, attempts to make them seem deviant and strange. Likewise, American Middle East foreign policy has long been criticized for the tendency to support corrupt autocratic dictators friendly to elite capitalists (particularly oil companies). (222)

The war on terror, post 9/11, attempted to defeat an invisible enemy, and consequently terrorism engulfed postmodern politics. The US obsession with terrorism became a virtual *raison d’état*, as its

tactics in counter-terrorism create more terrorism to feed back as an unending atmosphere of fear.

As Mahmoud Eid puts it, we are educated to imagine terrorism is a criminal act while media are a positive phenomenon. But both sides help each other, simply because the media facilitate the terrorist goals, terror attacks provide substantial content and topics debate for journalism. Understanding terrorism as a way of communicating a violent message, Eid’s volume contains considerable criticism of an ostensibly free-value media. The mediatization of terrorism corresponds with a tactic beneficial for both terrorists and governments. Terrorism and media cohabit a swamp in which each produces the oxygen for the other to breathe.

Meanwhile, in order for both to survive, terrorists seek to garner public attention and the media seek to find stories to sell. In a sense, both parties target wide-ranging audiences (although for different purposes); hence, they interact in a highly toxic relationship that involves a process of exchange necessary for their survival. Acts of terrorism provide media stories that result in more broadcasts, press texts, and digital data bytes, while the media coverage brings public attention to terrorists—the oxygen necessary for their existent. (Eid 2014: 24)

Vincent Casaregola (2016) addresses the role of surveillance. He argues that more than a passive instrument, surveillance awakens our deeper fears, producing a psychological climate of self-limitation. A genre of films uses surveillance as the main theme. Based on an exploration of how these archetypes were formed, Casaregola writes that ordinary citizens were gradually pressed to accept control and strict surveillance as a normal rule simply because it enhances security. Instead of seeing government invasions of privacy as real violations, cinema has indoctrinated audiences to ignore the limitations imposed by the security state. Since the beginning of the twentieth century,

the factory system, among other things, employed surveillance as part of a toolkit to exert control over workers and exploit them. Later, ruling elites introduced the same to government apparatuses. Various state bureaucracies manipulated surveillance to gain or keep dominance over the masses. In this vein, recent movies portrayed a futurist realm where the decline of liberty and autonomy leads to the rise of dictatorial governments. In movies such as *Minority Report* (2002), or *Gattaca* (1997), the plot present humans not as weary workers, but as passive consumers, who voluntarily sacrifice their liberties for entertainment. Movies have often served as propaganda vehicles in which enemies are demonized like the Nazis during the Second World War and Communists in the Cold War. Now terrorists and organizations like al Qaeda and ISIS serve as the antagonists who reveal the vulnerability of the United States that reinforces the culture of surveillance.

It is clear that our concerns about observing and being observed continue to proper our interest in political thrillers in which surveillance, lawful or not, plays a major role. We identify with the spies and law enforcement officials whose assiduous but authorized surveillance preserves our own safety, yet we suspect that not all such individuals or organizations are careful or caring enough not to make serious errors. We also doubt that they would have the moral courage to admit such errors subsequently, allowing the innocent to suffer rather than leaving themselves open to criticism or even prosecution. Additionally, we fear that government may be neither benevolent nor benign in tis surveillance but corrupt and Machiavellian, maintaining control over us rather than keeping us secure. (Casaregola, 2016: 72)

From Counterfeit Politics to the Needs for Plots

Politics today consists in the need to introduce secret plots as a valid source of legitimacy to impose policies that otherwise would never be accepted

by voters. Such so-called counterfeit politics or conspiracy theories are typically interpreted as a pathological form of politics, which is based on paranoia and can lead to chaos. In contrast David Kelman has taken an opposite tack in his *Counterfeit Politics, Secret Plots and Conspiracy Narratives in the Americas* (2012). Kelman is basically treating the problem of ideology as a key factor of secrecy. The idea of secrecy rests on the legitimacy of silence which produces two contrasting circuits, official and unofficial. It presents a disestablishing event that intersects both stories. The credibility of one story is linked to the secret that allows the discovering of the other. In these terms, the theory of conspiracy, Kelman argues, does not threaten legitimate politics as is commonly thought. Crossing the cultures of Latin and Anglo-America, Kelman's says that conspiracy reveals a problem, its secret is necessary to articulate specific policies that otherwise would be rejected. He defines conspiracy as a narrative with political effects. Counter intuitively, Kelman maintains that conspiracy does not flourish in dictatorships, but in the core of liberal democracies. Far from being a social pathology, conspiracy is a key factor of politics that represents a valid effort to unravel an obscured story.

Across all modern democracies, politics needs to include a conspirational fable to legitimate an official one-sided and authoritative discourse. Kelman provides an all-encompassing model to understand the coming and goings of politics in the Americas: "politics is not based on an ideology decided in advance, but it is rather constituted through a specific type of narrative that is often called conspiracy theory. This type of theory is always a machination, that is, a narrative mechanism that secretes, as it were, ideological labels such as the right or the left" (p. 8). The success of this process depends on its ability to pose two contrasting groups, we and they, to impose an "antagonist relation" of competence. Therefore, every conspiracy narrative alludes to a double structure, where the visible story is continuously eroded by a secret one.

In explaining the political struggle as an unlimited game, rather than a hierarchical line of power, Kelman suggests that conspiracy seems not to be a symptom of decline or crisis, but the necessary condition for one discourse to gain hegemony. Politics, in his terms, can be defined as an illusory state of emergency where the sense of community (we) is opposed to others, who are the enemies (they). Conspiracy narratives, Kelman adds, are always placed in a near future, never in present reality. "Politics occurs when one discourse is being undermined and ultimately replaced by other contrasting voice".

Kelman provides a fresh alternative to reading modern politics, but his argument is based on ideology instead of politics. Rather, our argument rests on the idea that conspiracy closes the doors for interrogating ideology. Starting from the premise that political narratives, whatever their nature may be, explain an undesired situation to keep the status quo, it is almost impossible for conspiracy to lead to a radical change.

S. Murillo (2008) has explained that ideology is not an illusory story told to gain legitimacy, but the human fantasy to control death. So, we are ideological animals in our vulnerability. Alvin Gouldner (1976) offers a more political viewpoint without existentialist baggage.

Ideologies, then, are belief systems distinguished by the centrality of their concern for What Is and by their world-referencing "reports." Ideologies are essentially public doctrines offering publicly scrutable evidence and reasoning on their behalf; they are never offered as secret doctrines... Ideologies are intended to be believed in by those affirming them publicly and by all men, because they are "true," and they thus have a universal character... With the waning of traditionalism, there is now an increasing struggle over "ideas." This means a greater struggle over which definitions of social reality (or reports) and which moral rules (or commands) are dominant. Social struggle in part takes the form of contention about What Is and what should be done about it. (33-34)

The ideology fabricated and transmitted to the world says that United States is a mega-political power, whose hegemony is global. This power, from its inception, attempted to expand egalitarian values (democracy for example) to all countries to strengthen their collective well beings. But if the United States is this benevolent and powerful all seeing eye, why was 9/11 not prevented? A tentative answer would be that US officials were familiar with the possibilities of an attack. The theory of conspiracy exhibits the other pole of ideology. Any conspiracy poses valid efforts to make controllable what in nature is uncontrollable. Whenever the reality principle overrides the fiction, the theory of conspiracy responds with the questions that ideology keeps open. The hermeneutic circle of conspiracy works as a mechanism to validate the official discourse, silencing those voices which might bring a radical shift for the system. It takes part as a significant element of ideology, not politics. Last but not least, in psychology, conspiracy and paranoia are adaptive mechanisms of a frustrated ego. Paranoia surfaces to explain the failures of ego to reach goals in the life, which leads to the rejection of the reality principle. The meaning of safety, where ideology works, opens an ongoing quest which never ends. Inasmuch we look for safety, we feel less safe (Skoll & Korstanje, 2012).

DISCUSSION

J. Robert Oppenheimer was the scientific director of the Manhattan Project, the US program to develop the first nuclear weapons. The success of the program resulted in US President Truman authorizing the atomic bombings of the cities Hiroshima and Nagasaki in Japan, eventually killing hundreds of thousands. Oppenheimer speaking in a 1965 television broadcast about the moments following the first successful test of an atomic bomb, the Trinity test: "We knew the world would not be the same. A few people laughed, a few people cried. Most people were silent. I remembered the

line from the Hindu scripture, the *Bhagavad-Gita*. Vishnu is trying to persuade the Prince that he should do his duty, and, to impress him, takes on his multi-armed form and says, 'Now I am become Death, the destroyer of worlds.' I suppose we all thought that, one way or another."

Technology opens ethical dilemmas by making possible what had not hitherto been possible. What is possible is time bound and culture bound, and therefore dependent on the prevailing patterns of social relations, or social structure if you will. And here is where ideology plays a singular role. To paraphrase Karl Marx (1932) from *The German Ideology* which he wrote in 1845-6, the hegemonic ideology of a given time and place is the ideology, the belief system in Gouldner's terms, of the ruling class. The ruling class's view of the world is that which justifies their position and power. Their position and power derive from the sum total of all material social relations, which themselves are based on how the available forces of production are used to reproduce social relations. Technology is another word for the forces of production. Inevitably the development, deployment, and use of the forces of production will fit with the prevailing ideology.

What Oppenheimer recognized was his social role, the part he played, in developing a new force of production, or in its immediate use, force of destruction. Oppenheimer took responsibility for what he did. In contrast, Hannah Arendt in her conception of the banality of evil pointed to instances where people did not take responsibility, and relied on the dual mechanisms of bureaucratic procedures and technology to deny their participation. Those mechanisms of denial and the prevailing ideology—that of Nazism in Adolph Eichmann's case—decouple individual subjects from their actions. Just as Eichmann could say, in effect, that he was just doing his job by employing railroad timetables to move people around greater Germany. The timetables and rail movements were his immediate technology. They served to separate him from what he did so as to preserve his self conception as a moral

man. Technologies in association with prevailing ideologies operate similarly today. Consider for instance US personnel who operate military drones that murder people half a world from where they sit at their controls. Eichmann could think that what he did was justified because the people he arranged to transport people, mostly Jews from Nazi-conquered Europe, presented a threat to the German people. Drone operators can think they are protecting the American people from terrorists. It comes down to the same thing.

The crucial ethical question is about responsibility. Oppenheimer took it; Eichmann did not. The difference, pace Bauman, does not lie in a new kind of liquidity. The twenty-first century is no more liquid than those that preceded it, at least not where ethics matter. Today's drone operators can rationalize what they do as fighting terrorism. They work in the main state apparatus of repression and violence in the world: the US military-intelligence complex. Among its personnel, and among the US population at large, the ideology of a war on terror is part of the product of the umbrella state ideological apparatus most of which relies for its dissemination on the mass media. Today's mass media are faster than those in the past, and they are accessible to a greater portion of humanity. For example, a copy of *The Times* of London in the nineteenth century could take weeks to reach the functionaries in Britain's far lung empire. Today's drone operators can get their ideological messages from the *New York Times* almost instantaneously even while they are murdering people in Afghanistan. British imperial ideology was no less effective; however, than US ideology is today.

If there is a difference introduced by global electronic communication, it is that today more people interact at a distance. In 1876 in London a far greater proportion of social interactions were face to face than today where people use Facebook, Twitter, and various social media to carry on their social lives. To converse with a Facebook friend, one need only consult one's Smartphone, whereas in 1876 London, people had to go out into the

street, to coffee houses or pubs. This does produce a difference, but it is not one of liquidity. It is that today proportionately more social interaction occurs through a single channel of communication that imposes strictures on human perception. With face to face interaction in contrast, many channels operate simultaneously—including so-called body language, use of interpersonal space, odours, dress, demeanour, and so on. Today's social interactions lack such fullness, and therefore social relations are impoverished by reliance on contemporary mediation through electronics. By impoverishing interactions and social relations, more people are more susceptible to control by ideological state apparatuses than in the past.

Another difference that marks the early twenty-first century is that of an increasing mismatch between the forces of production and the relations of production. Relations of production follow a late nineteenth to twentieth century model. Those relations conform to monopoly capitalism and national economies, and still retain the character of Fordist mode of production. Fordist production is spatially centralized, and depends on a stationary workforce. Focus on electronic communication, computers, and the like misses the central changes and contradictions. Today production is increasingly decentralized in which component parts of products, raw materials, and capital machinery can be spread across a dozen or more locations. Automobile production offers a paradigmatic example. Auto parts might be crafted in 20 different countries, using raw materials from another 20 locales, with final assemblage not holding the determining role in manufacture. The most mobile part of the process is finance in which money speeds around the world via electronic transfers. Coordination is supplied by electronic cybernetics. Production, including finance, is mobile while workforces remain stationary, and often work is performed at some spatial remove from the manufacturing machines—that is, machine operators and the machines may be separated somewhat similarly to drone operators mentioned above. With increasing reliance on electronic cybernetics which replaces

mechanical cybernetics—for example, electronic sensors replacing mercury thermostats—fewer and fewer workers are needed to produce goods and services that make up the global commodity market. A consequence is the growing wealth and income gap, a phenomenon that has been a global phenomenon for at least the last 20 years. Where under Fordism capital required a reserve army of labour, today such a workforce is merely redundant. The potential for revolution becomes more unmistakable daily. To contain it, both the repressive and ideological apparatuses of the state work to keep the lid on. Being dazzled by speed, speed of communication, and technological virtuosity, misses the fundamental social changes currently underway.

CONCLUSION

In the abstract and in and of themselves, science and technology are morally neutral endeavours. The discovery of nuclear energy, for instance, merely furthered our knowledge of the physical universe. But science and technology do not remain abstract for long. As soon as they enter into the forces of production they become subject to the requirements of the current mode of production and the structure of social relations that are associated with it. Moreover, the prevailing ideology sets the truth conditions for all deployments of technology and even whether scientific discoveries are acknowledged. Historical examples abound, but to mention just a few, many of Nikola Tesla's discoveries and inventions have been ignored if not actively suppressed. Television was technically feasible in the 1920s and was available in a small region in the 1930s, but it did not become commercially viable until after the Second World War when the radio broadcast companies decided to embrace it. Mobile phones, which simply use the principle of point-to-point radio transmission were technologically possible in the first decade of the twentieth century, but it was only the US Telecommunications Act of 1996 (PL 104-104,

110 Stat. 56) that made them a reality. Penicillin was discovered in 1928, but it was not used as an antibiotic until 1942. It is not technology that makes for a better world; it is people. Only when humanity takes responsibility and works together to make a better world for everyone, will such a world be possible.

FUTURE RESEARCH DIRECTIONS

Current technology for the protection of people is not enough. It never will be until humanity takes into its own hands the welfare of all people. Future research must be humanistic in the broadest and deepest sense of the word. Until we force the technical to serve all human kind, it will forever serve only the interests of the privileged few.

KEY TERMS AND DEFINITIONS

Digital Surveillance: The use of digital technology to control others, citizens, and the life of a nation.

Disaster: It represents A disruption of functioning of a society that leads to economic or material losses, affecting the tolerance of society to react. Disasters appear when the possibility to answer towards risk are vulnerated.

Ideology: A cognitive framework of truth conditions.

Nuclear Power: It is The use of nuclear energy to produce heat which is channelled steam turbines to get electricity. Nuclear power has escalated a tension between US and Soviet Union during Cold War.

Plot: Secret narrative that evokes a theory of conspiracy which is hidden from the public.

Privacy: Right of peoples and their group to keep their own information from others.

Risk Perception: It is The perception of any potential threat or danger which can affect the well-functioning of society, groups or people.

Terrorism: v. Violent coercion of other people.

Users Behavioral Intention Towards eGovernment in an African Developing Country

Ayankunle A. Taiwo

Texas A&M University – Commerce, USA

INTRODUCTION

Sequel to successful implementation of electronic commerce in the private sector, huge amounts has been invested in e-Government globally. Nevertheless, evaluating results of the investments using numerous metrics shows disappointment in most developing countries. With impending failures of e-Government initiatives in developing nations (Maumbe, Owei & Alexander, 2008), it is important to note that implementation of e-Government without redesigning the processes is tantamount to waste of public funds and resources. Having targeted users in mind brings about efficient and effective e-government services, not bureaucracy. Importantly, the accomplishment of e-Government initiatives hinges on rethinking and redesigning processes that the government operates. Also, as critical as technologies is to e-Government, its' optimal results is not exclusively dependent on technological innovation, but the combination of technology and end users. Furthermore, channels of distributing government solutions ought not to make the difference, but high quality of services through the channels.

Presently, public sector of many developed nations utilizes the power of the Internet as an outlet for public service provision. Flavin, Guinaliu, & Torres (2006) iterated that arrival of internet came with substantial advantages for all stakeholders concerned. After a successful e-commerce exploits by the private sector, government of many countries sort after provision of public services over the internet. e-Government comes with enormous

gains to the governments, including reduction in delivery cost of public services with a wider reach to the people. Furthermore, citizens can have access to varieties of solutions because operations are no more time bound by office hours. Although lots of funds have been spent on building e-Government systems, studies have shown that citizen may not use the systems for many reasons (Olasina, 2012). The most important stakeholders (citizens) in e-Government are often left behind while crucial decisions are made. Interestingly, the greater impact is on the citizens, because their behavioral pattern will have to change. In addition, there have always been resistant to change, thus citizens acceptance of e-Government can be complicated, because it affects human behavioral patterns (Meuter et al., 2002). Therefore, reviewing factors that influences human behavior towards technology cannot be overemphasized. The objective of this paper is to investigate behavioral intention towards the use of eGovernment service in Nigeria, a developing country.

BACKGROUND

The National Information Technology Development Agency (NITDA) was initiated by the Nigerian government as a passage for eGovernment to bring government closer to its citizens and facilitate national strategies for the spread of e-society / e-government (NITDA, 2001; Obasanjo, 2003, 2004). The expectation of the eGovernment initiatives is to use Information & Com-

munication Technologies (ICT) for breaking “barriers of hierarchical traditions, secrecy, and bureaucracies” (Obasanjo, 2004; p1) associated with public services. Numbers of eGovernment initiatives were rolled out to prepare citizens for the change towards eGovernment, encourage citizens to use eGovernment applications and build trust in citizens to reduce future resistance (Ifinedo, 2007). The implementation of eGovernment was also foreseen as a way to curtail the effect of corrupt practices as eGovernment initiatives were employed in India to combat corruption (Ifinedo, 2007). Also, e-government initiatives were expected to improve culture, transparency and accountability in the country.

Recent studies shows that the implementation and the use of eGovernment in Nigeria is less than desirable while some of the challenges facing eGovernment initiatives are yet to be resolved (Ifinedo, 2005; 2007). A research survey conducted by Awoleye, Oluwaranti, Siyanbola & Adagunodo (2008) revealed that the use of eGovernment application is low and 20% of the respondents out rightly lack interest in visiting government websites. The current state of eGovernment in Nigeria is beyond preliminary stages. There are several eGovernment services available across the country at local, state and federal level, many of which are not patronised due to workers negative attitude to change and citizens’ negative perceptions about eGovernment (Olasina, 2012). Some of these services could be found on the website for government services “services.gov.ng”. Nigerian immigration eservices are one of the surviving and successful eGovernment initiatives in Nigeria. The targeted population in this study, undergraduate and post-graduate students, are individuals who have used online services provided by the Nigerian government for immigration (immigration.gov.ng) purposes. Chete et al., (2015) investigated the use of SMS based eGovernment services in Lagos Nigeria and suggested that mass media is the most effective way to show citizens the benefits of using eGov-

ernments services. In addition, there are limited empirical studies on eGovernment in Sub Sahara African nations (Maumbe et al., 2008). Lastly, Ifinedo (2007) suggested the investigation of the perceptions of Nigerians regarding the eGovernment acceptance in Nigeria.

LITERATURE REVIEW

Unified Theory of Acceptance and Use of Technology (UTAUT)

The acceptance of information technology has been carefully investigated dynamically for the last four decades. Looking through the technology acceptance literature, many studies proposed models and examined them to show vividly more than forty percent variance in a persons’ intention to adopt technological a innovation (Davis et al., 1989; Venkatesh & Morris, 2000). Venkatesh et al (2003) made a concrete examination of eight (8) prominent models and derived a unified concept of acceptance and use of technology (UTAUT) which could explain around 70 percent of variance in intention. The eight (8) technology adoption models studied consist of the theory of reasoned action (TRA), the technology acceptance model (TAM), the motivational model (MM), the theory of planned behavior (TPB), a model combining TAM and TPB (C-TAM-TPB), the model of PC utilization (MPCU), the innovation diffusion theory (IDT), and social cognitive theory (SCT).

Performance expectancy, effort expectancy, and social influence of the UTAUT model show significant immediate determinants of behavioral intention while facilitating condition is a determinant of usage behavior (Venkatesh et al., 2003; Taiwo & Downe 2012). These constructs have usually been validated in lots of empirical reports for being essential factors that influences users’ acceptance of a system (Guo & Barns, 2007; Iahad & Rahim, 2011; Taiwo et al., 2014).

Relationship Between Performance Expectancy and Behavioural Intention

In many previous studies, it has been found that a positive relationship exist between performance expectancy and behavioral intention towards using a particular technology. Goh and Yoon (2011) found performance expectancy as a predictor of behavioural intention in an empirical study to investigate facilitators of virtual world acceptance. In addition, Venkatesh, Sykes and Zhang (2011) investigated the acceptance of electronic medical record (EMR) system by medical doctors, and found that performance expectancy significantly predicts behavioural intention to accept and use the EMR system. Besides, Foon and Fah (2011) found performance expectancy to be significant in predicting users' intention to accept and use Internet banking. Nawaz & Thelijagoda (2015) investigated citizens' behaviour towards eGovernment services in Sri Lanka and found performance expectancy to be a significant predictor of intention to use eGovernment services. Gupta, Singh & Bhaskar (2016) investigated citizens' adoption of eGovernment services at New Delhi Municipal Council (NDMC), results suggests that performance expectancy is significant factor that predicts intention to use eGovernment services. As such it is hypothesized that:

H1: Performance expectancy has a direct positive relationship with behavioural intention.

Relationship Between Effort Expectancy and Behavioural Intention

It is found that significant positive relationship exist between effort expectancy and behavioural Intention. Venkatesh, Sykes and Zhang (2011) investigated the acceptance of electronic medical record (EMR) system by medical doctors and found that effort expectancy significantly predicts behavioural intention to accept and use the EMR

system. Also, Wang and Shih (2009) found effort expectancy as a significant predictor of behavioural intention to accept the use of information kiosks in Taiwan. Niehaves and Plattfaut (2010) found effort expectancy to be a predictor of intention to use Internet amongst elderly citizen in Europe. Furthermore, Chiu, Fang and Tseng (2010) also found effort expectancy to significantly predict consumers' intention to accept the use of a kiosk technology. Nawaz & Thelijagoda (2015) investigated citizens' behaviour towards eGovernment services in Sri Lanka and found effort expectancy to be a significant predictor of intention to use eGovernment services. Furthermore, Gupta et al., (2016) explored intention to adopt eGovernment services at a local Municipal Council and found that effort expectancy have a significant positive relationship with intention to use eGovernment services. As such it is hypothesized that:

H2: Effort expectancy has a direct positive relationship with behavioural intention.

Relationship Between Social Influence and Behavioural Intention

Previous researchers confirmed significant relationship between social influence and intention to adopt. Maldonado et al (2009) employed only social influence amongst the three UTAUT predictor of intention alongside with some other cognitive variables, and found out that social influence significantly predict students' intention to use an educational portal. Also, Foon and Fah (2011) found social influence to be significant in predicting users' intention to accept and use Internet banking. Wang and Shih (2009) investigated the acceptance and use information kiosks using the UTAUT and found out that social influence significantly predict behavioural intention towards the use of the information kiosk. In a study to know what factor would predict citizens' use of Internet services, Niehaves & Plattfaut (2010) found effort expectancy to be a predictor of elderly citizens' intention to use Internet in Europe. Nawaz &

Thelijjagoda (2015) investigated behavioural intention to use eGovernment services in Sri Lanka and found social influence to have a significant influence on intention to use eGovernment services. Gupta et al., (2016) investigated citizens' adoption of eGovernment services at New Delhi Municipal Council (NDMC), results suggests that social influence have a significant influence on intention to use eGovernment services. As such it is hypothesized that:

H3: Social Influence has a direct positive relationship with behavioural intention.

Relationship Between Facilitating Conditions and Behavioural Intention

Facilitating conditions are the degree to which people believes that there are organizational and technical infrastructures are available to support the use of a system (Venkatesh et al., 2003). Venkatesh, Sykes and Zhang (2011) investigated the acceptance of electronic medical record (EMR) system by medical doctors and found that facilitating condition significantly predicts behavioural intention to accept and use the EMR system. Similarly, Foon & Fah (2011) found facilitating condition to be significant in predicting users' intention to accept and use Internet banking.

Similarly, Niehaves & Plattfaut (2010) found facilitating condition to significantly influence intention to use Internet amongst elderly citizen in Europe. Similarly, Chiu, Fang and Tseng (2010) also found facilitating conditions to significantly predict consumers' intention to accept the use of a kiosk technology. As such it is hypothesized that:

H4: Facilitating conditions have a direct positive relationship with behavioural intention.

Web Trust

Mayer et al (1995) gave a simple definition of Trust as the belief that other party will behave in

a socially accountable way. Therefore, the trusted will fulfill the trusting party's expectations without taking benefit of its vulnerability. Taking a cue from McKnight & Chervany (2002), perception in e-Government in relation to trust can be described as a combination of beliefs that make it easy for a citizen to willingly become susceptible to egovernment after taking careful thoughts into its characteristics before usage. According to Rexha et al (2003), absence of trust is one of the main reasons why certain people are still reluctant to conduct financial transactions online or give away personal information over the internet.

Importantly, citizens are more likely to use web services offered by government agencies with very good reputation. For that reason, citizen's confidence in the e-government provider is crucial to e-government acceptance. Trust and trust related issues on electronic services have been investigated widely in e-government research (Carter&Belanger; Welch, Hinnat& Moon, 2005, Taiwo, Downe & Loke 2014). Several studies have used the web trust by McKnight et al (2002) to investigate users' intention (Metehan, & Yasemin, 2011).

Relationship Between Disposition to Trust and Behavioural Intention

It has been found that there exist a positive relationship between disposition to trust and Behavioural Intention. McKnight, Chevany and Kacmar (2002) applied the web trust model to investigate the human trust on the internet. The construct disposition to trust was validated as reliable alongside trust intentions and was found to have a significant influence on personal innovativeness of the individual. Colesca (2009) investigated the importance of trust in eGovernment acceptance and found disposition to trust (propensity to trust) as an important factor that predicts intention to accept a technology. Taiwo et al (2014) investigated the effect of citizens' disposition to trust on behavioural intention to adopt eGovernment services and found disposition

to trust as a significant predictor of intention. As such it is hypothesized that:

H5: Disposition to Trust has a direct positive relationship with behavioural intention.

Relationship Between Institution Based Trust and Behavioural Intention

In relation to institution based trust, it often used as trust of Internet or Technology (Belanger et al., 2008; Teo et al., 2009). Trust in Internet for government services (eGovernment) comprises of the conventional view of trust as a specific entity (government) and the dependability of the Institution that enables technology (trust of the Internet) (Carter and Belanger, 2005; Belanger and Carter, 2008). Colesca (2009) investigated the importance of trust in eGovernment acceptance and found institution based trust (trust in technology) as an important factor that predicts intention to accept a technology. Belanger and Carter (2008) investigated the influence of trust and risk in eGovernment adoption and found Institution based trust (trust of Internet) to be an important factor in determining acceptance and adoption of eGovernment services. Furthermore, in an empirical study to uncover factors that could significantly influence the decision of citizens of developing countries to accept eGovernment services, Taiwo et al (2014) found institution based trust to have a significant positive effect on behavioural intention to adopt eGovernment services. Also, Gupta et al., (2016) found trust of technology to have a significant relationship with intention to use eGovernment services at a local municipal council in India. As such it is hypothesized that:

H6: Institution based trust has a direct positive relationship with behavioural intention.

Relationship Between Trusting Belief and Behavioural Intention

Trust belief is a construct that has gained wide attention of IS researchers on users behavioural intention on the Internet. The construct has also been adapted in several technology adoption studies (Chen, Liu, Song and Qian 2008; Cheng, Liu, Qian 2008).

Citizens with high Trusting belief in a government agency are more likely to accept eGovernment services. Dashti, Benbasat and Burton-Jones (2009) investigated the role of trusting belief in Government, and found trusting belief (trust in eGovernment) to be an important predictor of intention to adopt eGovernment. Gupta et al., (2016) found Trust in Government (trusting belief) to have a significant relationship with intention to use eGovernment services at a local Municipal Council in India. Using the above discussion and other studies that have applied the construct in the field of eGovernment trust (Belanger and Carter 2008; Teo et al 2009, Taiwo et al 2012; Taiwo et al., 2014). As such it is hypothesized that:

H7: Trusting Belief has a direct positive relationship with behavioural intention.

METHODOLOGY

Data Collection

Quantitative research method was employed in this study to investigate the intention to use eGovernment services in Nigeria. Therefore, using a face to face approach, a total of 500 questionnaires were randomly distributed among undergraduate and postgraduate students in four Nigerian Universities (University of Ilorin, Federal University of Technology Minna, Ladoke Akintola University of Technology and Ajayi Crowther University). The rationale behind the selection of student popula-

Figure 1. Research framework

tion is that; they represent hopeful future and early adopter of eGovernment services in the country. The questionnaire consists of ten (10) sections. The first section contains screening questions regarding the use of Nigerian immigration website and eGovernment in general. The second section collected demographic data. While the remaining sections collected data on the UTAUT and Web Trust dimensions. Out of 500 subjects, 310 usable questionnaires were received giving a response rate of sixty two percent (62%).

Measures

Using the literature as a guide we integrated dimensions that could possibly reveal the factors that affect citizens' behavioral intention and developed structural model to see the influence of the dimensions on behavioural intention. Our research model (see Fig.1) shows the proposed model which integrates the Performance Expectancy, Effort Expectancy, Social Influence and Facilitating Condition with Web trust dimensions; Disposition to Trust, Institution based Trust and Trusting Belief to investigate how the combination can provide a more a better understanding towards citizens' intension to use the identified e-Government service.

DATA ANALYSIS AND RESULTS

Preliminary Statistics

The gender distribution of the study subjects was forty four percent (44%) females and fifty six percent (56%) males respectively. Respondents between the ages of 18-30 formed the largest age group ninety percent (90%) with a total of 189. Sixty percent (60%) of the respondents had communicated with the government online before. The cronbach alphas of all the constructs are above the recommended value of 0.7 except for peer influence at 0.639, which is considered satisfactory for this study (see Table 1).

Furthermore, Pearson's correlation between the observed constructs, findings revealed that the there are moderate correlation between the constructs. Table 2 shows the correlation between the variables.

Discriminate validity was assessed by calculating Composite reliabilities in the measurement model which ranged from 0.6900 to 0.8217 (see Table 3). Nunnally& Bernstein, (1994) recommended cutoff of 0.70, but social influence construct has a (CR = 0.6900), but its value is close to 0.70, therefore it was retained for further analysis. Convergent and discriminant validity was

Table 1. Constructs reliability and validation table (N=310)

Variables	Total Item	Chrobach Alpha	Fit Indices						
			χ^2	df	χ^2/df	GFI	CFI	RMSEA	p-Value
Performance Expectation (PE)	4	0.707	1.45	2	0.725	0.99	0.99	0.000	0.48
Effort Expectancy (EE)	5	0.700	5.56	5	1.112	0.99	0.99	0.023	0.35
Social Influence (SI)	4	0.639	1.24	2	0.62	0.99	0.99	0.000	0.54
Facilitating Conditions (FC)	4	0.774	0.68	2	0.34	0.99	0.99	0.000	0.71
Disposition to Trust (DTT)	5	0.793	5.05	5	1.01	0.99	0.99	0.007	0.41
Institution-Based Trust (IBT)	5	0.709	6.08	5	1.216	0.99	0.99	0.032	0.30
Trusting Belief (TB)	4	0.705	2.29	2	1.145	0.99	0.99	0.026	0.32
Behavioral Intention(BI)	3	0.702	0	0	0	1	1	0.00	1

assessed in terms of average variance extracted (AVE). All constructs have an AVE greater than 0.5 as recommended by (Fornell & Larcker, 1981), except social influence construct has a (AVE = 0.4905), but its value is close to 0.50, therefore it was retained for further analysis (see Table 3).

Structural Model

A structural equation modeling (SEM) was used to analyze the data using Listrel 8.52. By categoriz-

ing and combining all the predictors found in the literature, a structural model was developed and tested to see the effects of all endogenous variables on behavioral intention. The study revealed that Performance expectancy, effort expectancy and facilitating condition are significantly related to behavioural intention with standardized coefficients of ($\beta=0.21, p<0.05$), ($\beta=0.23, p<0.05$) and ($\beta=0.15, p<0.05$) respectively. Social influence does not have a significant influence on behavioural intention with a standardized coefficient of

Table 2. Correlation matrix, component reliability, AVE and roots of the AVEs (shown as diagonal elements) (n=310)

	Composite Reliability	AVE	1	2	3	4	5	6	7	8
BI	0.7040	0.5275	.726							
PE	0.8217	0.5120	.673	.716						
EE	0.7046	0.5090	.681	.639	.713					
SI	0.6900	0.4905	.687	.564	.604	.700				
FC	0.7260	0.5155	.494	.469	.610	.465	.717			
DTT	0.8019	0.5532	.591	.419	.558	.544	.430	.744		
IBT	0.7538	0.5008	.647	.601	.636	.615	.538	.611	.708	
TB	0.7273	0.5132	.737	.697	.662	.677	.531	.583	.735	.716

**Correlation is significant at the 0.01 level (2-tailed) Average variance extracted (AVE) = (sum of squared standardized loading)/[(sum of squared standardized loadings) + (sum of indicator measurement error)]. Composite reliability = (sum of standardized loadings)²/[(sum of standardized loadings)² + (sum of indicator measurement error)]. Indicator measurement error can be calculated as 1 - (standardized loading)².

Figure 2. Structural model

Table 3. Hypothesis testing results (path analysis)

Hypothesis	Path	β	T	Comment
H1	PE $\rightarrow$ BI	0.21	3.96	Supported
H2	EE $\rightarrow$ BI	0.23	4.98	Supported
H3	SI $\rightarrow$ BI	0.04	0.74	Not Supported
H4	FC $\rightarrow$ BI	0.15	3.27	Supported
H5	DTT $\rightarrow$ BI	0.10	1.19	Not Supported
H6	IBT $\rightarrow$ BI	0.10	1.67	Not Supported
H7	TB $\rightarrow$ BI	0.28	5.73	Supported

($\beta=0.04$, $p<0.05$). Amongst the Web Trust dimensions, only trusting belief have positive significant influence on behavioural intention with a standardized coefficients of ($\beta=0.28$, $p<0.05$). Disposition based trust, Institution based trust does not have significant influence on behavioural intention with a standardized coefficients of ($\beta=0.10$, $p<0.05$) and ($\beta=0.10$, $p<0.05$) respectively. Furthermore, the goodness of the theoretical model was established by the variance explained (R^2) of the independent variables on behavioral intention as 0.71, which implies that the model accounts for 71 percent of variance in intention to use eGovernment. Therefore, H1, H2, H4 and H7 are accepted. While H3, H5, H6 were not accepted (See Figure 2 and Table 3). Furthermore, with the exception of the p-value all other fit indices are above the recommended values (Hair et al 2006; Suki & Ramayah, 2010).

DISCUSSION

The purpose of this study is to examine behavioral intention to use eGovernment services in Nigeria using the UTAUT dimensions; Performance Expectation, Effort Expectancy, Social Influence and Facilitation Conditions. And three dimensions of the Web Trust Model; Disposition to Trust, Institution Based Trust and Trusting Belief. The outcome of the study revealed that Performance Expectancy has a significant relationship towards behavioural intention. This is in line with previous studies by Niehaves & Plattfaul (2010), Venkatesh et al (2011), Nawaz & Thelijagoda (2015), Gupta, et al., (2016).

Effort Expectancy has a significant relationship towards behavioural intention. This is consistent with previous studies such as Niehaves & Plattfaul

(2010) and Venkatesh et al (2011). This suggests that people will use eGovernment services when they perceive that it will assist them to gain efficiency receiving services from the Government conveniently.

Facilitating Condition has a significant relationship towards behavioural intention. This is consistent with previous studies such as Dashti,et al., (2009)and Nawaz & Thelijjagoda (2015). This suggests that people will use eGovernment services when they perceive that it will be easy for them to use.

Trusting Belief has a significant effect on behavioural intention. This is in line with the studies of Dashti,et al., (2009), Taiwo et al., 2014 and Gupta, et al., (2016). This suggests that people will use eGovernment services when they have confidence in the government to fulfill its obligation to its citizens.

In this study, Social Influence, Disposition to Trust and Institution based Trust do not have significant influence on behavioural intention. This could be as a result of the high level of education of respondents employed in this study.

The proposed structural model shows that Performance Expectation, Effort Expectancy, Facilitation Conditions and Trusting Belief can explain 71% of the variance in behavioural intention to use eGovernment. This shows that the model has relatively good predictive power on behavioural intention to use eGovernment.

LIMITATION AND SUGGESTIONS FOR FUTURE RESEARCH

This study is not without some limitation. First moderating effects in the previous UTAUT models were not explored. Second, most of our respondents are working students and it would be interesting to see the outcome of other samples. Future works could explore the effect of moderators and other dimensions on intention.

CONCLUSION

Towards a successful acceptance of eGovernment, it is expedient for the government to focus on actual issues that surrounds the use of electronic services provided to the people. Such as working on trust related strategies before and after introducing e-services to the people. Improving on such strategy can improve positive perception of the people towards using eGovernment. As efforts are currently on ground towards accountability and transparency in governance, such efforts should be intensified to increase citizens' belief in the government that they will fulfill their electoral promises.

The outcome of this study revealed that trust in relevant government agencies and institution can be of great importance in creating positive perception for citizens to accept e-Government initiatives. Trust has been an important composite of any good relationship as people will promote the services with words of mouth (Ongori, 2009). Most importantly, this study shows that trusting belief in government agencies is a strong predictor of citizens' intention to adopt eGovernment. Therefore, Nigerian government must endeavour to increase trusting relations with its citizens. Because when there is high level of trust in the government, perception of citizens towards e-Government will be positive and the likelihood of acceptance will increase.

KEY TERMS AND DEFINITIONS

Behavioural Intention (BI): The degree to which people are willing to perform a specific behaviour towards the use of technology.

Disposition to Trust (DTT): An individual's tendency to be willing to depend on others.

Effort Expectancy (EE): The degree of ease associated with use of the computer systems.

Facilitating Condition (FC): The degree to which an individual believes that organizational and technical infrastructures are available to support the use of the system.

Institution Based Trust (IBT): The level to which an individual believes structural conditions are good enough to support his or her success.

Performance Expectancy (PE): The degree to which an individual believes that using a computerised system will assist him or her in increasing his or her job performance.

Social Influence (SI): The degree to which an individual sees that important others believe he should use the new computer system or technology.

Structural Equation Modeling (SEM): Class of methodologies that seeks to represent hypothesis about summary statistics derived from empirical measurements in terms of smaller numbers of “structural” parameters defined by a hypothesized underlying model.

Trusting Belief (TB): An individual’s confidence that the trade partner shall fulfill his or her transactional obligations as expected by the member.

UTAUT: Unified theory of acceptance and use of technology.

Young People, Civic Participation, and the Internet

INTRODUCTION

This chapter reviews the emerging body of literature on the online civic participation of young people. Following swiftly on the advent of the internet in the 1990s, this literature emerged and expanded rapidly in the context of the ways in which Western policy makers seem to have construed young people as generally not properly motivated or skilled to participate in civic activities. Many scientific studies have also portrayed young people as inactive compared to older age cohorts or previous generations of young people. This depiction of apathy and disaffection has been particularly emphasized in regard to more traditional civic or political activities, such as voting and membership of political parties (Banaji & Buckingham, 2013).

It is against this backdrop that the widespread ‘mediatization’ of contemporary young people’s lives has prompted media and political science scholars to question whether and how new media technologies, particularly the internet, might reinvigorate civic participation amongst young people. The attribution of civic potential to internet activities constitutes the newest episode in old scholarly discussions about what civic participation envelops. The next section outlines the contours of these discussions, as well as the development of the literature on young people’s civic participation online. The section thereafter

discusses the (sometimes conflicting) forms of knowledge and insights that have been produced within four strands of empirical research on young people’s online civic participation. The last two sections consist of a discussion of directions for further research and a conclusion.

BACKGROUND

The online activities to which civic potential has been attributed differ in nature and in form. Aside from visiting informational sites, recent forms of online participation have been described as more ‘interactive’ and include activity on online petition platforms, forums, blogs, photo sharing sites such as Instagram, video sharing platforms such as YouTube, micro-blogs such as Twitter, and social network sites such as Facebook. Studies that have investigated people’s participation in such activities have been conducted, as outlined below, in the context of wider discussions about the activities that should be considered as civic in the first place. Therewith impacting on any conclusion drawn about the manner and extent of young people’s civic participation, these discussions have formed a major thrust behind the literature on online civic activity of youth. The second part of this section discusses the historical development of this literature about young people’s online civic participation.

What is the Civic?

People's participation in activities within the formal political arena has received much attention within political science research (Van Deth, 2011). Voting and activism for a political party are among the most prominent of these activities. Studies that have focused on participation in such activities have generally concluded that there is some sort of democratic 'deficit' or 'crisis' among young people in particular. Such research has, for instance, concluded that contemporary young people, compared to older age cohorts or previous generations of youth, vote less and are less knowledgeable about formal political processes (Bakker & De Vreese, 2011).

However, an increasing number of scholars have objected to the notion that non-participation in these traditional activities signifies a problem *per se*. These scholars have asserted that, for young people, such activities are often not appealing in the context of their circumstances and everyday life. Some have maintained, for instance, that young people are not attracted to politicians' communication style and that they lack the feeling that participation in traditional political activities is effective (Banaji & Buckingham, 2013a).

For these reasons, young people are presumed, by some, to have embraced various forms of issue-based participation outside the formal political arena. Some of these activities are considered as 'traditional', such as participation in demonstrations and signing petitions. Other activities are considered as more 'individualistic' or 'creative', and mainly include activities related to consumption, such as buying organic, eco-friendly and fair trade products, or the activities on the internet mentioned above. While there are evident differences between these activities, most of them have in common that they are, or can be, conducted outside formal organizational structures. These activities, in this sense, are not only 'extra-parliamentary', but also 'extra-institutional' (Hirzalla & Van Zoonen, 2010).

Online Civic Participation

The differences in the activities on which scholars have focused signify that the very meaning of civic participation has changed and been contested historically. The study of internet-based civic participation has also been through different stages. Shortly following the advent of the internet, studies began theorizing the medium's potential impact on society and democracy. These studies often foresaw extreme interpersonal and socio-political changes, either utopian or dystopian by nature. On the one hand, studies depicted the individuality of internet applications as a sure recipe for socio-political tragedy, with high levels of internet use expected to result in, among other things, diminishing levels of collective civic action, face-to-face interactivity, civil debate, or the scrutiny of political authority (e.g., Street, 1992). On the other hand, there were studies that predicted that citizens will effectively use the internet to contest political or economic authority or benefit from direct democracy (e.g., Negroponte, 1995).

Early studies continued to revolve around theoretical speculation on these issues, but were also increasingly prescriptive in nature, addressing how websites should be designed by NGOs or governmental agencies if they are to successfully improve people's attention for civic issues. Recommendations for 'best practice' in this respect concern, among other things, the organization of the personnel that produce websites and the preferred modes of communications online. A list with such recommendations comes from Stephen Coleman (2008), who prescribes, among other things, total freedom of expression; dialogic links with those in authority; and clear agreements about what involvement will achieve.

Studies that were conducted in the last decade or so, however, were increasingly based on empirical research, inquiring into whether, how and why the internet might promote civic participation. The next section provides a concise overview of the key knowledge and insights that have been

produced over the years by the four main strands of empirical research.

FOUR STRANDS OF EMPIRICAL RESEARCH

Interview-Based Studies of the Production of Civic Internet Applications

Relatively few qualitative, interview-based case studies have focused on the production of internet applications with an apparent civic potential. The overall goal of these studies has generally been to explore how the backgrounds, circumstances and experiences of website producers relate to their website producing activities, reflecting on how the communicative effectiveness of websites is affected by potential discrepancies between the internet-mediated messages that website producers intend to communicate (the meanings ‘encoded’ in internet content) and how internet users interpret these messages (the ‘decoded’ meanings); how the production of content online depends on producers’ resources in terms of, among other things, finances and personnel; and how the functionalities, subject matters, interface design and structure, and mode of address of websites are intertwined with the worldviews and institutional goals of the web producers (e.g., Banaji & Buckingham, 2013b; Branigan & Mitsis, 2014).

Several studies have also begun to explore questions about networking and political connectivity within cyberspace from the perspective of activist producers. Kevin Gillan’s (2009) study of the exploitation of online civic networks by anti-war activists, for instance, suggests clear parallels between the general aims and forms of these activist groups and the designs and purposes of their online campaign materials and strategies.

Text-Based Studies of Civic Content Online

A second research branch is composed of qualitative case studies of civic content online. These studies have generally attempted to illustrate how internet applications *do* have a civic potential. While not based on analyses of *who* uses web applications, a portion of this research does focus on youth sites in particular. The best-known example of this type of study is the work of Kathryn Montgomery and her colleagues (2004) in the US civic sphere online. Based on their exploration of 300 sites, they found that the American-based, youth-oriented internet offers an abundance of informative, communicative and participatory civic potential.

Other studies focused on sites that are not aimed at young people, but produced general claims about the civicness of the internet. Especially the self-representations and discussions on forums and e-democracy projects, it is maintained, resemble a ‘virtual sphere’, a concept derived from Jürgen Habermas’ (1962/1989) thesis on the ‘public sphere’. In this sphere, discussants exchange critical and reasoned arguments about socio-political matters. Evidence suggesting the existence of a complex, stratified online public sphere where debate of such matters can take place is not merely explored within websites that explicitly aim to engage citizens with civic issues. It is also claimed that such debate is conducted on the sites of entertainment programs, such as the British reality TV series *Wife Swap* (Graham, 2012). Furthermore, public spheres have also been found in authoritarian contexts, where open and critical debate is less likely to happen in traditional media (Rauchfleisch & Schäfer, 2015).

However, aspects of these claims have been contested. Some questions raised relate to the accessibility of this online public sphere to all

citizens regardless of location, class, age and other demographic features (e.g., Banaji & Buckingham, 2009). Other studies have queried the civicness of the discussions taking place, even drawing attention to propagandist or inflammatory networks of the far right in the online public sphere (e.g., Harindranath & Khorana, 2013). Scholars have also warned that undemocratic powers use social networks sites as surveillance tools and propaganda channels, and that the role of social networks in the contestation of such powers can be easily overestimated (e.g., Morozov, 2011).

Survey-Based Research on Civic Internet Use

Survey-based studies, which form a third strand of research, have generally yielded less optimistic conclusions about the internet's civic potential. These studies have mainly aimed to investigate patterns in the circumstances, attitudes and skills of people that use the internet for civic purposes (e.g., Oyedemi, 2015) and their ability to understand civic content online (e.g., Bowyer & Kahne, 2015); the material or attitudinal factors that influence or are influenced by civic internet use (e.g., Lee, Shah & McLeod, 2013); and, to a lesser extent, how civic internet use is related to civic participation offline or duration and forms of traditional media use (e.g., Vissers & Stolle, 2014).

While various methodological and theoretical issues within these themes remain contested, some findings are gaining consensus. For instance, the internet seems to be still primarily used for recreation and social communicative activities, although civic and political purposes are gaining ground (Banaji & Cammaerts, 2014). Other studies have indicated that, while some 'digital divides' in internet access *intensity* may be gradually diminishing in developed countries, they are not in developing countries, and there are also still discrepancies in internet use *forms*, with groups of (young) people equipped with relatively low levels of material or attitudinal resources (such as media literacy) using the internet less for civic action

than groups that possess more of such resources (Oyedemi, 2015).

Further, youth and others who are civically active online are often also civically active offline. Survey-based studies, therefore, have often acknowledged that the internet has a potential to promote civic participation, but that this potential has yet to be fully realized (Hirzalla & Van Zoonen, 2010). This is not to say, however, that the internet has no purpose at all on top of civic activity offline. People who would normally not participate offline may use the internet in civic ways. Hence, while for most people the internet seems to play a reinforcing role (i.e., supporting existing patterns in offline participation), it can also mobilize new people into digital forms of civic participation (Vissers & Stolle, 2014).

Interview-Based Research on Civic Internet Use

A fourth strand of research has also focused on the young users of internet applications, but has paid more attention to the role of context and culture, and has relied on qualitative methods, mainly in-depth interviews and focus groups, sometimes in combination with ethnographic, participant observation methods. Some of these studies have attempted to clarify how youth are civically active and engaged, yet in their own ways and on their own terms, which are allegedly misunderstood in survey-based research (e.g., Bennett, 2007). Other studies have been oriented at assessing how young people may consider internet technologies as a valuable resource for civic participation (e.g., Thorson, 2014; Vromen, Xenos & Loader, 2015). A third group of studies in this category attempted to yield detailed insights into the aforementioned 'digital divide' problem, mainly in relation to young people's ability to understand internet technologies, and social factors that may influence young people's access of the internet (e.g., Bobkowski & Smith, 2013; Linne, 2014). Based on in-depth interviews and participant observation among Latino immigrant families

in the American context, Lisa Tripp (2011), for instance, found that young people can be clearly restricted in their opportunities to go online due to the attitudes of their parents as well as policies of their schools. Lastly, some studies have looked into how young people experience political marketing which NGOs or governments conduct to engage and mobilize them. Loader, Vromen and Xenos (2015), for example, found on the basis of a qualitative assessment of discussions online by young people that:

the effectiveness of social media use in mobilizing support is likely to depend upon the receptiveness of politicians and political celebrities to the expectations and performative demands of young networking citizens. (...) The overwhelming majority of our young citizens were cautiously open to the prospect of politicians and political discussion being an aspect of their social networking, provided that politicians used social media appropriately. The clear implication being that social media could indeed be an effective channel for politicians to connect with young citizens, but that in order to do so they would have to develop more authentic digital personas (pp. 15-16).

The Roots of Incongruence

In sum, the literature about online civic participation among young people is widely varied, with studies focusing on different research questions, and assessing these questions through different methods. In this light, it should not be surprising that extant research provides different and, in some respects, conflicting cues about the internet's civic potential for young people. Here, it is possible to distinguish between at least two interrelated analytic axes along which the knowledge and insights produced in extant research tend to conflict.

First, across the four strands of research, there are differences between studies that have focused on the civic *potential* of the internet on the one hand, and studies that have focused on the actual *realization* of the internet's civic potential on the

other. Compared to the former group of studies, the latter group is generally more pessimistic about the role of the internet in young people's civic life.

Second, within extant research, there are often differences in the conclusions between survey-based studies that focus on *patterns* in civic internet use on the one hand, and text-based studies that focus on the characteristics of civic *manifestations* online (i.e., information, self-representations and discussions) on the other. Compared to pattern-oriented research, studies that focus on online manifestations have concluded far more frequently that the internet's civic potential is obvious and valuable for internet users.

It should be noted, however, that studies on different sides of either one of these axes do not yield *empirical* conclusions that are necessarily incongruous. Rather, scholars' *theoretical* inferences from empirical evidence tend to vary along these axes, with potential- and manifestation-focused studies most often generating optimistic inferences, and realization- and pattern-focused studies generally yielding more pessimistic inferences.

Underlying most of the differences between the research strands and transcending discrepancies in research focus are more fundamental issues concerning scholars' epistemological approaches. On the one hand, survey-based studies have generally taken a more 'positivistic' approach by, among other things, generalizing the role of perception, meaning and context. Based on deductively constructed and quantifiable units of analysis, such as the extent to which people report engaging in civic participation, such studies construct generalizing claims through statistical techniques. On the other hand, qualitative studies, conducted within a 'post-positivistic', 'interpretative' tradition, presume that such claims cannot reveal the whole story since, for instance, closed-question surveys may disaccord with the intricate ways in which people make sense of the world. Such studies, therefore, turn to building theory on the basis of inductive explorations of the perspectives and experiences of those involved in producing and using civic spaces online.

FUTURE RESEARCH DIRECTIONS

This section discusses a number of directions for further research. These suggestions call primarily for more pressing context-specific and people-centered research approaches, which may stimulate scholars to further review some of the incongruent or even conflicting forms of knowledge and insights produced over the years, and yield novel and more rigorous understandings of the role of the internet in young people's civic lives.

First of all, while qualitative research has partly focused on online civic participation, survey-based studies have distinguished rather persistently between online and offline civic participation. New insights might be gained, however, when people's perspectives on participation are taken as an analytic point of departure, rather than their activities. Such an approach might underpin explorations of how activities generally, regardless of their online or offline form, can be straightforwardly embedded in people's motivations and interests.

Taking young people's perspectives more centrally into account might also motivate scholars to move beyond the 'democratic' narratives on which their empirical analyses and theoretical inferences may be based. Most notably, many studies in the field have assumed that young people's participation is motivated by civic attitudes (e.g., a belief that changing or contributing to society is possible) and/or civic goals (e.g., a desire to change or contribute to society). However, social and personal factors, such as a desire to make new friends or earn a living, may also play a role but have hardly been explored by extant research.

A third research innovation pertains to the focus of survey-based studies on *general* patterns in online civic participation. People might use particular internet applications for civic purposes at particular moments only, when events occur that are experienced as 'special' or highly relevant for their personal lives. Investigating these instances of temporary civic internet is bound to alleviate the tensions between studies that focus on general patterns in people's civic participation online,

and studies that focused on online manifestations of such behaviors. More specifically, evaluating who participates in the online civic discussions and self-representations that are celebrated by text-based studies will reveal whether these online manifestations are generated by a wide public of any age group (or rather only by those people who are civically active and engaged on a structural level), and, in so doing, whether the rather pessimistic conclusions about general patterns in civic internet use can be nuanced with more sanguine observations of civic internet use in particular contexts.

The relevance of context-specific and people-centered approaches becomes furthermore evident from the few studies conducted to date that contrasted aspects of the foregoing survey and textual data with interview-based research. Although studies have been expanded significantly and methods refined over the past decade to include such triangulation of data, there remains much one-dimensional scholarship. Triangulation, however, can reveal the complex interactions of technological, social, historical and economic factors in shaping the manner and extent to which internet applications are used for civic purposes.

Triangulation will also be highly relevant in the newest chapter of new media research, which revolves around 'Big Data'. In the context of media and communication science, Big Data refers to relatively large amounts of internet content that can be collected, analyzed and reported automatically or semi-automatically. The innovative software programs that accomplish these things provide, among other things, bigger samples (if not populations) of data than generally can be collected manually, and they enable large-sample content analyses that would be too cumbersome and time consuming to do manually. With these bigger samples and analyses on larger scale, it is possible to produce fuller and more detailed insights into the textual, sentimental and networked nature of civic content online. These text-based insights, however, reveal little (if any) information about the producers of civic content. Furthermore, the

results yielded by automated content analyses are generally confined and quantified, rather than thick and specific. Therefore, to interpret the results of Big Data analysis properly, it will be important to triangulate such analysis with further qualitative interview- and text-based research (Hirzalla, Müller & Van Zoonen, 2013).

CONCLUSION

This article discussed the socio-political and theoretical background of the literature on the question as to whether and how the internet may promote young people's internet-based civic participation; which main strands of empirical research on that issue have emerged over the years; and in what ways and for what reasons different forms of knowledge that have been produced by extant research seem to be intrinsically incompatible. The suggested directions for future research should not only alleviate those tensions between the divergent forms of knowledge, but also alter the rather standardized narratives in the literature about youth's online civic participation, which, as a partial artifact of the differences in scholars' research focus and methods, have all too often been constructed either as an elitist exercise that normalizes offline business as usual, or as a panacea for old socio-political inequalities. More nuanced narratives may lie somewhere in the middle, and are yet to be fully developed by this young but lively field of literature.

KEY TERMS AND DEFINITIONS

Citizenship: Status referring to citizens' formal duties and rights, as well as informal norms regarding their behavioral and attitudinal commitments to social and political life in a democracy.

Civic Engagement: Attitudinal commitment of citizens to norms and processes deemed political or social by nature.

Civic Participation: Participation in activities deemed political or social by nature.

Democracy: A society formally and culturally organized to enable eligible citizens to participate equally in decision-making processes.

Political Engagement: Attitudinal commitment of citizens to norms and processes that are deemed parliamentary political by nature.

Political Participation: Participation in activities deemed parliamentary political by nature.

Young People: People between 12 and 30 years old.

Electronic Health Record (EHR) Diffusion and an Examination of Physician Resistance

Kristen MacIver

Northern Michigan University, USA

Madison N. Ngafeeson

Northern Michigan University, USA

INTRODUCTION

Since the enactment of the United States Health Information Technology for Economic and Clinical Health (HITECH) Act in 2009, there has been substantial progress in the diffusion of Electronic Health Record (EHR) systems in medical clinics throughout the United States. Many physicians, however, continue to resist adopting EHR technology despite several recognized long-term benefits and available government sponsored financial incentives. The objective of this article is analyze physician resistance to EHR technology adoption. Previous researches indicate that physicians have been reluctant to adopt EHR systems due to high implementation and maintenance cost besides the uncertainties associated with EHR's return on investment. Apart from financial cost, physicians also seem to encounter challenges in adopting EHRs due to lack of technical skills, time, and technical support. Workflow disruption, loss of autonomy, confidentiality issues, and interoperability are major challenges hindering the adoption of EHRs (Ajami & Arab-Chadegani, 2013; Lorenzi, Kouroubali, Detmer, & Bloomrosen, 2009). Moreover, an annual report prepared by the United States Department of Health and Human Services (2014) shows that, loss of productivity, lack of adequate training and incompatibility of EHRs with practice needs are the top reasons why physicians resist the adoption of EHR systems. With the awareness of the major physician barriers

to the adoption of EHR technology, stakeholders and policy makers can address barriers and pursue actions to mitigate or reduce physician resistance to achieve nationwide diffusion targets and pursue initiatives to digitize all patient records.

Although physicians are hesitant to adopt EHR technology, there are several benefits of EHR systems that make the technology worth adopting. Evidence from healthcare research and systematic reviews show that the benefits of EHRs continue to grow and include: enhancing the accurate collection, storage and sharing of medical information of patients with authorized personnel to support informed decision making, prevention of medical errors, availability of data for clinical research and analysis (United States Department of Health and Human Services, 2014). The Institute of Medicine and other stakeholders in the healthcare field suggest that the wide-scale adoption of EHR systems could be pivotal for improving patient safety and health care quality and could reduce the costs of providing ambulatory care (Ajami & Bagheri-Tadi, 2013). It is generally accepted that EHRs could also improve efficiency, portability and research capabilities (Pipersburgh, 2011).

Given the potential benefits of EHRs, physicians could be helped to overcome their barriers to adopting EHR technology. For example, physicians can be more productive or efficient and effective if their routine tasks are automated. With the input of physicians, automated technologies could be produced to handle repeated tasks and

DOI: 10.4018/978-1-5225-2255-3.ch319

daunting processes. Physicians will then be able to spend more time with patients and workflow interruptions will be eliminated as well. This research illuminates the challenges encountered by physicians in adopting EHRs, and suggests how future research could tackle these.

BACKGROUND

An EHR can be defined as a digitally stored record of an individual's healthcare information used for supporting the continuity of care, education, and research (Ajami & Arab-Chadegani, 2013). The Health Information Technology for Clinical Health (HITECH) Act, which was enacted as a part of the American Recovery and Reinvestment Act (ARRA) of 2009, served as a turning point in the evolution of EHR technology in the United States. The HITECH Act was signed into law with the explicit intention of accelerating the adoption of Electronic Health Records (EHRs) by physicians, and since its enactment, the program has distributed billions of dollars to physicians for adopting certified EHRs through the meaningful use (MU) program (Mennemeyer, Menachemi, Rahurkar, & Ford, 2016). One research study noted that through December 2015, the federal government had made \$13 billion worth of EHR incentive payments to physicians and other eligible professionals who

met stage 1 of meaningful use (Cohen, 2016). Overall, the stimulus act included a requirement that grant recipients achieve all meaningful-use requirements, including interoperability, by the end of 2017 (Sandler, 2016).

In acute care hospitals, there has been substantial growth in the adoption of basic and certified EHR systems (Charles, Gabriel, & Furukawa, 2014). In 2014, 3 out of 4 hospitals had adopted at least a basic EHR system which represents an increase of 27% from 2013 (Charles et al., 2014). Figure 1 delineates the growth in the percent of non-federal acute care hospitals with adoption of at least a basic EHR system and possession of a certified EHR system from 2008 to 2013 (Charles et al., 2014).

EHR adoption has also been on the rise for rural practices which has reversed initial trends (Hirsch, 2015). A new study by the Journal of the American Medical Informatics Association (JAMIA) revealed that EHR adoption in rural areas was 56 percent compared to 49 percent in urban areas, and the study concluded that 27 states have adoption rates statistically higher in rural areas than in urban areas (Hirsch, 2015). The USA is not alone in its efforts of EHR implementation and use. Figure 2 shows notable efforts by other organizations in key developing countries.

Despite the progression of the technology and broad agreements on the benefits of EHR

technology, many physicians in the United States remain hesitant to adopt. Research shows that that the diffusion and physician acceptance of EHR technology may be hindered by a variety of intrinsic and extrinsic barriers (Paré et al., 2014). The purpose of this study is to explore the most prominent perceived challenges and barriers that physicians face in adopting EHR technology. Specifically, this study is intended to answer the question, “Why do physicians resist the adoption of EHR technology?”

This study utilizes a systematic review of literature on physicians’ resistance to the adoption of EHRs. The literature on physicians’ resistance and perceived barriers to the adoption of EHRs and EHR technology was completed through a research database search engine. The search employed various combinations of keywords such as electronic health record, electronic medical record, barriers, physicians, resistance, and adoption to search for previous research and literature related to this study. Journal articles used in this study were based on relevance to physician bar-

riers to the adoption of EHR technology although many of the detailed barriers to adoption of EHR technology are applicable and relevant to other user groups. Research databases leveraged in this study include journal articles and digital articles or reports. Approximately thirty-three articles were reviewed for this study and twenty-seven of the articles met or supported the specific criteria of this study which focused on physician barriers to adoption of EHRs. Moreover, approximately 67 percent of all the reviewed journal articles were cross-referenced and analyzed.

PHYSICIAN BARRIERS TO ADOPTION OF EHRs

In most clinical settings, physicians' orders trigger most determinants of healthcare quality and costs (Zaroukian, 2011). Although other users, groups, or factors may influence the adoption of EHR technology in a clinical setting, this study focuses on physician resistance since efforts to achieve health information technology (HIT) transformation will not succeed unless the physicians support the desired improvements in quality and value of new technology (Zaroukian, 2011).

The professional journals reviewed in this study maintained many similarities in categorizing or sub-categorizing physician barriers to adoption of EHR technology. The most common barriers identified in this study are outlined in the following categories: cost restraints, technical constraints and system limitations, time constraints and workflow disruptions, physiological constraints, social influences, and privacy and security concerns. A review of twenty-seven articles from 2004 to 2016, found in twenty-five databases showed that there are six major categories of physician barriers to EHR adoption as follows:

Cost Restraints

The short-term and long-term financial investments for an EHR system remains a significant

barrier to EHR system adoption for practices without large IT budgets (Ajami & Bagheri-Tadi, 2013). Financial issues including adoption and implementation costs, ongoing maintenance costs, loss of revenue associated with temporary loss of productivity, and declines in revenue may deter physicians from adopting an EHR system (Menachemi & Collum, 2011). Given the infancy of EHR systems and its use in the United States, there is not substantial evidence on the long-term return on investment (ROI) of EHR systems. Thus, studies reveal that physicians worry that their practices will face substantial financial risk without a promise of return (Boonstra & Broekhuis, 2010). Additionally, research shows that many financial benefits of an EHR do not accrue to the provider but rather to the third-party payers in the form of errors averted and improved efficiencies, which generally translate to reduced claim payments which can be another concern for physicians (Menachemi & Collum, 2011).

Technical Constraints and System Limitations

The successful implementation of EHR technology requires users and suppliers to have enhanced technological capabilities. Most users, even highly regarded and leading healthcare organizations, consider EHRs to be challenging to use because of the multiplicity of screens, options and navigational aids (Miller & Sim, 2004). Research has concluded that physicians generally have insufficient technical knowledge and skills to deal with EHRs which results in resistance (Boonstra & Broekhuis, 2010). The skills needed to communicate with a patient, analyze medical relevance, complete interventions as well as type notes simultaneously would require a significant level of concentration, typing skills, and familiarity with the application's user interface. These multiple requirements and additional tasks resulting from the use of EHR technology could be seemingly overwhelming to physicians (Ajami & Bagheri-Tadi, 2013). To foster efficiency and ease of use

for physicians, many vendors of EHR technology have worked to improve usability of their systems, but many vendors doubt that even the most significant upgrades to their systems, such as voice recognition, will dramatically simplify EHR usage (Miller & Sim, 2004). For physicians, a lack of technical skills paired with complex usability requirements is likely to create further resistance to their acceptance or adoption of EHR technology.

Given the complexity of EHR systems, vendor technical support and troubleshooting are crucial factors in the successful implementation and continuation of EHR systems. Many physicians who have implemented EHR systems complain of poor service, follow-up, and training from contracted vendors. These complaints have created a negative perception for non-users who are considering the technology (Boonstra & Broekhuis, 2010). Poor vendor reputation is a barrier to adoption as many physicians are concerned that vendors are not qualified to provide the proper service or will go out of business and disappear from the market, leading to a lack of technical support and financial loss (Ajami & Bagheri-Tadi, 2013).

Another major physician barrier to the adoption of EHR technology is the concern about system capabilities and limitations. Many physicians report that they cannot find an EHR system that meets their specific needs or requirements (Boonstra & Broekhuis, 2010). Results of a study indicated that approximately 54 percent of physician participants who did not have access to an EHR system, could not find a system to meet their specific needs (DesRoches et al., 2008). Despite the progression of EHR system technology and a willingness of many EHR vendors to tailor clinic services and functionalities, customization typically comes at a premium and may raise concerns of system stability and longevity. These factors can deepen financial concerns and be viewed as another risk that may add to physician resistance for EHR system adoption.

Another technical barrier to adoption is EHR system reliability. Reliability, in this context, is described as the dependability of the EHR tech-

nology systems (Randeree, 2007). In leveraging EHR systems, reliability is notably important for a system dealing with patient information, and many physicians are concerned about losing access to patient records if computers crash, viruses attack or during events of power failure (Boonstra & Broekhuis, 2010). Research reveals that physicians are also hesitant to adopt EHR technology out of fear of the possibility of record loss due to technical deficiencies which could translate into financial loss and be costly for a clinic (Boonstra & Broekhuis, 2010).

Given the immaturity of EHR technology, EHR systems must be adapted or altered to connect with other devices that complement the EHR system. However, many physicians have reported problems of interconnectivity leading to a negative perception of the transfer capabilities of current EHR technology (Boonstra & Broekhuis, 2010). The majority of EHR systems are not compatible with existing practice systems; consequently, physicians may be hesitant to replace fully functional systems with a fully integrated EHR system (Boonstra & Broekhuis, 2010). Additionally, research shows that there are hundreds of varying types of EHR software programs currently in use, and inconsistent data standards have prevented existing systems from being capable of transferring data (Valdes, Kibbe, Tolleson, Kunik, & Petersen, 2004). Manual data transfer to a new, fully integrated EHR system could lead to a loss in productivity or could increase costs for a clinic if third-party data transfer is required. Physicians may be resistant to adopt EHR technology because several EHR systems lack data transfer capabilities, which is a potential source of inefficiency and high cost.

Time Constraints and Workflow Disruptions

EHR systems are complex and require extensive research, training, and adaptations to workflow to be successful. Physician involvement during system initiation and selection is important

because participation in the assessment and implementation of EHR systems will provide an opportunity for physicians' information needs to be communicated, considered or addressed during the implementation process (Lorenzi, Kouroubali, Detmer, & Bloomrosen, 2009). Additionally, several research studies have found that successful EHR system implementation is usually driven by a core team that includes physician champions. Physician champions are imperative to the successful implementation of a new EHR system as they typically drive change and motivate staff to buy-in to the new system. Despite the need for physician involvement in a core team or in the EHR selection processes, perceived time constraints serve as a significant physician barrier to EHR system adoption. During initiation stages, research uncovers that many physicians are not willing to invest time in EHR system selection and procurement as they believe that they should spend their time and efforts with patients (Paré et al., 2014).

Physicians have also expressed concerns over the potential time constraints that would result from the implementation of an EHR system which also serves as a barrier to EHR system adoption (Boonstra & Broekhuis, 2010; Paré et al., 2014). It is accepted that physicians will need to spend a considerable amount of time, effort, and training learning how to use an EHR system. Unfortunately, many physicians believe that learning an EHR system would slow their workflow and increase their workload besides thinking that they would not have the time needed to effectively learn an EHR system given the demands and pressures of delivering office-based care (Boonstra & Broekhuis, 2010). Although utilizing an EHR system could increase efficiency for physicians in the long term, the complexity of EHR systems paired with a seemingly daunting training timeline creates resistance to EHR adoption for physicians. This resistance occurs especially if physicians do not support or believe that EHR systems will increase their efficiency.

With regard to concerns over post-implementation time loss, many physicians believe that

EHR systems will interfere with the doctor-patient relationship (Boonstra & Broekhuis, 2010). This negative perception might have come from some physicians who have used EHR systems and are reporting that sometimes they stop using the technology during interactions with the patient because hunting for menus and buttons disrupts the clinical encounter (Ajami & Bagheri-Tadi, 2013). Therefore, physicians may be led to believe that they will need to spend more time with each patient due to EHR system usage (Paré et al., 2014). Taking extra time to use an EHR and not being compensated for taking on more work also suggests why physicians may hesitate to adopt EHR system (Ajami & Bagheri-Tadi, 2013).

Physiological Constraints

Personal resistance and physician skepticism towards EHR systems also serves as a barrier to EHR system adoption. Studies have found that more than half, approximately 58 percent, of physicians without an EHR doubt whether or not the technology can really improve patient care or clinical outcomes, and other research studies argue that those physicians who are unwilling to use such a system are skeptical about claims that EHRs can successfully improve the quality of medical practices (Boonstra & Broekhuis, 2010). Physicians' negative perceptions are generally derived from social influences; and to compound the barriers that social influences may create, people are generally afraid of change which can further slow the diffusion of technology (Boonstra & Broekhuis, 2010).

Professional autonomy, which can be described as an individual's control over the environment, processes, procedures, or content of their work, is important in the working practices of physicians (Boonstra & Broekhuis, 2010). In regard to professional autonomy, some physicians are concerned that using an EHR platform may result in a loss of their control of patient information and working processes since data will be shared with and assessed by others (Boonstra & Broekhuis, 2010).

Other research findings reveal that physicians are concerned that policymakers, insurers, and administrators will use EHRs as a proxy mechanism to influence, or dictate how they practice medicine (Ford, Menachemi, Peterson, & Huerta, 2009). Threats to professional autonomy are an important factor in EHR acceptance or resistance because privileges associated with professional autonomy directly link to social value systems, status, and economic outcome. Therefore, physicians are likely to support elements that foster their autonomy and resist those that may threaten their professional autonomy (Walter & Lopez, 2008). A survey of physicians found that 68 percent agreed or strongly agreed that having clinical freedom was essential in practicing medicine and that constraints to clinical freedom should be fought (Walter & Lopez, 2008).

Social Influences

Lack of support from external entities is another barrier to physician adoption of EHR technology. One study noted that one-third to one-half of physicians reported that their decision-making was affected by local and regional organizations that were not active in the EHR debate (Boonstra & Broekhuis, 2010). Internally, many physicians also experience lack of support from other colleagues or their management team which may demotivate them to pursue EHRs for their clinic. Overall, lack of internal and external support may create further physician hesitation to EHR adoption as research suggests that support from either within a physician's practice or from reliable third parties is essential to overcome knowledge barriers and to configure EHR applications in ways that facilitate improved clinical practices (Davidson & Heslinga, 2007).

Privacy and Security Concerns

Many physicians' perceptions of EHRs is that they are not secure, and that patient information may become accessible to unauthorized entities which

can translate into legal problems and be costly for a clinic (Boonstra & Broekhuis, 2010). Even among physicians who use EHRs, most believe that there are more security and confidentiality risks involved with EHRs than with paper records (Boonstra & Broekhuis, 2010). There have been many reports of accidental loss or theft of sensitive clinical data as EHRs can be vulnerable to hackers, viruses, and worms (Fernández-Alemán, Señor, Lozoya, & Toval, 2013).

With EHR systems, it is also difficult to maintain privacy as administrative staff could access information without the patient's explicit consent (Fernández-Alemán et al., 2013). Although patient privacy and confidentiality have been a major topic of discussion through the progression of EHR technology in the healthcare field, one study finds that physicians may harbor more concerns for patient privacy and confidentiality than the patients themselves (Simon et al., 2007). Reports of internal and external data breaches have heightened physicians' concerns over patient privacy and confidentiality and may serve as another potential detriment to their acceptance and adoption of EHR technology.

IMPLICATIONS FOR RESEARCH AND PRACTICE

This review of literature provides a broad range of the perceived physician barriers to adopting an EHR platform. All reviewed research suggests that the diffusion and physician acceptance of EHR technology may be hindered by a variety and/or mixture of intrinsic and extrinsic barriers. The barrier categories identified are not all inclusive, but outline the most common physician barriers to the adoption of EHR technology as discovered through the analysis and systematic review of multiple articles and journals related to physician resistance to adoption of EHRs. With regard to EHR system adoption, the most common barriers encountered by physicians include: cost restraints, technical constraints and system limitations, time

constraints and workflow disruptions, physiological constraints, social influences, and privacy and security concerns.

Widespread adoption of EHR technology, applied correctly, could benefit clinics and improve healthcare in the United States (Kumar & Aldrich, 2010). The detailed physician barriers uncovered in this research, however, could continue to slow the diffusion of the technology and negatively impact the adoption of EHR systems by healthcare organizations and/or doctors who were already reluctant to adopt. As EHR technology progresses, those organizations who choose not to adopt will face a technological lag relative to their competitors which may be unattractive to patients seeking a modern healthcare experience. Apart from not being able to leverage the benefits of an EHR system, physicians who choose not to adopt an EHR platform may face financial penalties, in the form of Medicare payment cuts, for failing to meet federal electronic health record incentive-payment program standards (Conn, 2014). Research shows that there was a 1 percent penalty in Medicare reimbursements for physicians who failed to achieve meaningful use stage 2 in 2014, and that penalties will escalate to 2 percent in 2016 and 3 percent in 2017 (Conn, 2013).

Overall, failure to adopt an EHR platform could also hinder data sharing and data collection that is needed for research and analysis. Specifically, EHRs offer access to longitudinal data that could be used to predict future outcomes or diagnoses, providing opportunities for personalized decision making for a given patient (Wu, Roy, & Stewart, 2010). Physicians who choose not to adopt an EHR platform will not have the ability to efficiently contribute to data sets or benefit from the analysis of the data collected through EHRs. Therefore, the single most important implication of this research is that, the evidence-based information about the major barriers to physician resistance in adopting EHRs will be useful in formulating solutions to overcome these barriers. Equally important, more concrete solutions to the barriers highlighted in

this study may be explored in further research and analysis.

H

CONCLUSION

Despite accepted long-term benefits and available government sponsored financial incentives for the adoption of an EHR system, complete diffusion of EHR technology has not been realized in the United States as the technology continues to meet resistance from physicians. Overall, successful EHR adoption requires extensive research, investment, training, and adaptation to workflow to improve patient health and safety. The synopsis of physician barriers outlined in this study show that stakeholders and groups driving EHR system adoption need to be aware of the issues surrounding resistance to the system. By understanding and detecting physician barriers that are preventing the widespread adoption of EHR technology, stakeholders can work to mitigate resistance.

Although it is accepted that physicians' intrinsic barriers and social influences may be difficult to overcome, positive advancement in EHR technology usability and functionality could foster the creation of a stronger reputation for the technology thus reducing or removing negative perceptions. In consideration of financial constraints, the imbalance of cost versus return will continue to be a major factor and drive physician resistance until further research is provided on the potential ROI of the technology. The adoption of EHRs should be viewed as an ongoing process that will continuously need to evolve through system upgrades, interoperability, and continued training of staff (Mack et al., 2016). Overall, stakeholders must recognize that the "one size fits all" approach to EHR system technology and implementation is impractical and that, to meet targets of EHR system implementation to achieve positive healthcare outcomes, more work, time, education for physicians and evolution in the technology will be required.

KEY TERMS AND DEFINITIONS

EHR Adoption Barrier: An obstacle that restricts, prevents, or discourages the adoption of EHRs.

EHR Diffusion: The adoption or spread of EHRs.

EHR Resistance: The opposition to accepting EHR technology.

EHR Technology Adoption: The selection and use of EHR technology.

Electronic Health Records (EHR): A digital record of an individual's healthcare that is collected over their lifetime.

Healthcare Stakeholders: An individual or group with interest in the progression and technological advancement of healthcare.

Meaningful Use: The U.S. government mandate of 2010 requiring an eligible provider to use certified technology to meet specified government benchmark outcomes.

Internet of Things Applications for Healthcare

Ljubica Diković

Business Technical College, Serbia

INTRODUCTION

According to the US National Intelligence Council, there are six technologies with potential impacts on the US interests out to 2025 (the US National Intelligence Council, 2009):

- Biogerontechnology as a technology related to the biological aging processes;
- Energy Storage Materials;
- Biofuels and Bio-based Chemicals;
- Clean Coal Technologies;
- Service Robotics;
- The Internet of things.

The great potential offered by the Internet of Things technology enables their wide applications in many areas of society, which would significantly increase and improve the quality of their functioning. By equipping various environments, i.e. domains, even with devices with primitive intelligence and modest communication capabilities, the communication of these entities with each other would be possible, with an aim to ensure data management. Such systems can be widely used in the following areas:

- Healthcare Domain;
- Smart Environment Domain;
- Personal and Social Domain;
- Transport and Logistics.

BACKGROUND

The Internet of Things (IoT) refers to wireless networks between objects (things). ‘Things’, i.e. objects, become entities with virtual properties which operate and communicate in smart spaces using intelligent interfaces.

Also, the “Internet of Things” is the general idea of things, especially everyday objects that are readable, recognizable, locatable, addressable, and controllable via the Internet - either via Radio Frequency Identification (RFID), Bluetooth, Wi-Fi, telephonic data services, wide-area network, or other means (the US National Intelligence Council, 2009).

In their research paper, Atzori et al. (2010) state that the Internet of Things can be realized in three paradigms: internet-oriented (middleware), things-oriented (sensors) and semantic-oriented (knowledge).

Over the last 20 years, continuous changes in the healthcare domain have taken place, caused by the wide use of information and communication technologies in the medical field. IoT plays a significant role in the broad range of healthcare applications which could be grouped as follows (Atzori et al. (2010)):

- Tracking of Objects and People (Staff and Patients);
- Identification and Authentication of People;
- Automatic Data Collection and Sensing.

The rapid growth of IoT has resulted in a massive growth of data generated by these devices and sensors put on the Internet. The physical-cyber-social big data consist of these IoT data, complemented by the relevant Web-based and social data (Sheth, 2016).

The Internet of Things has been identified as one of the emerging technologies in the IT field. The market adoption of IoT has been forecast to take 5–10 years (Gubbi et al., 2013).

The popularity of different paradigms varies with time. The web search popularity regarding the term IoT in industry, as measured by the Google search trends (n.d.) during the last 10 years, is shown as the red line for Germany and as the blue line for United States in Figure 1. As can be seen, the search volume is consistently increasing, and according to the Google search forecast, the trend is likely to continue. Average interest over time for United States is 22 and for Germany are 13. Numbers represent search interest relative to the highest point on the chart.

E-health in Serbia has been the subject of some studies. It was concluded that information and communication technologies are rarely implemented (Milenkovic et al., 2012).

IoT is a vision which refers to the humanization of technology.

IoT IN HEALTHCARE DOMAIN

Medical sensors are devices that measure a number of physical, chemical, or biological parameters and then transmit or report these data. Some sensors are designed to work outside the body, and others are implanted in the body.

In the healthcare domain, the Internet of Things in its essence covers the following (Li et al., 2009):

- **Body Area Network (BAN):** The thermometers, smart t-shirts, smart devices and sensors for health, paper-based home pregnancy tests, etc. supporting personal medical treatment and healthcare.
- **Wireless Body Area Network (WBAN):** Supporting remote medical treatment and healthcare.
- **Local Area Network (LAN):** The wireless access-based remote patient monitoring system, the smart devices as a hospital interface, pulse oximeter also known as the blood-oxygen monitor, etc.
- **Wide Area Network (WAN):** Telemedicine solutions, distance medicine, etc.
- **Very Wide Area Network (VWAN):** The smart healthcare solutions as e-health services everywhere, no longer tied to physical locations.

Figure 1. Google search trends since 2005 for the term Internet of Things

Tracking involves memorizing the positions in real time (e.g. patient flow monitoring) in order to improve work processes in hospitals, but can also refer to the general tracking of motion (e.g. the access to certain rooms, warehouses or inventory material tracking such as blood samples and other materials necessary for the hospital functioning). Identification of patients includes activities, actions and tasks aimed at reducing incidents harmful to patients (e.g. wrong drug, dose, time, and procedures), the maintenance and updating of the complete medical archives in the digital form. Identification and authentication include protocols and procedures regarding the work of medical staff, which promote morals and ethics of employees in order to increase patient safety. The automatic data collection and transfer involves the automation of various processes as well as the management of medical supplies. This function is supported by the integration of the Radio Frequency Identification (RFID) technology and other health information and technologies. RFID is a method of storing and downloading data remotely, using devices carrying tags. From the RFID group's point of view, the Internet of Things is the worldwide network of interconnected objects uniquely addressable based on the standard communication protocols (Gubbi et al., 2013). Sensor devices allow more successful diagnosis of patients in real time, provide various solutions in the field of telemedicine, warnings about the patient's condition and so on. They offer numerous opportunities that would provide, for example, a wireless access-based remote patient monitoring system, which would be designed so as to accompany the patient everywhere in real time, thus enabling continuous monitoring of the patient's bio-signals (Niyato et al., 2009).

CONCEPT OF M-HEALTH

As mobile technology becomes more affordable and widespread all over the world, using

the mobile-enabled technology when providing healthcare services has great potential to improve the health of millions.

Mobile Health, mHealth is a term used for medical and public health practice supported by mobile devices, such as mobile phones, patient monitoring devices, etc.

MHealth is a relatively new concept, but its main advantage is that it enables healthcare professionals to collect data about their patients at any time. The data is processed, analyzed and wirelessly communicated to a gateway device over a cloud. (Paschou et al., 2013; Paschou et al., 2015; Istepanian et al., 2004).

Considering that MHealth, as a part of eHealth, can be defined as the synergistic solution of mobile computing, a medical sensor, and communications healthcare technologies, whose common goal is wireless monitoring of the psycho-physical state of health or remote patient monitoring. In the Republic of Serbia, electronic health cards are a pioneering venture aimed at promoting mobile healthcare services (Milenkovic et al., 2012).

An MHealth solution usually consists of a unit designed for patients, which is composed of sensors for medical measurements and accessories, as well as a communication device for 2G and 3G communication, which forwards the data to the health system via the cloud. Because of their miniature dimensions, high performance and low cost/price, different sensors, which can be easily wirelessly connected, are used for the measurement of chemical, biological and physical parameters in the body. Also, there are a lot of web-based platforms that provide additional opportunities for the expansion of social networks for different purposes (e.g. health education of patients worldwide). Even more, the network of sensors can be connected via patient's mobile phone to a server that is located in a medical institution. The data collected by the sensor network can be periodically or in real time sent to the server, which approaches the patient's doctor suggesting corrective actions via e-mail or SMS. The program

can be set so as to, if the sensor encounters some irregularities, immediately notify a doctor, who could react momentarily.

Thanks to this approach, patients with chronic diseases can be under continuous remote supervision at home. In addition to the increased safety of the patient, it represents significant savings of hospital resources, and hospital beds remain available for other patients who need them. Also, this solution helps hospitals manage beds efficiently and consequently decreases hospital costs. Hospitalized patients whose health status requires full attention can be constantly monitored using IoT-driven monitoring (sensors).

The market division is as follows:

- Preventive care tools which help people stay healthy (e.g. Behavioral change, Community communication, Education).
- Curative care tools as new efficient ways to treat patients (e.g. Remote monitoring, Assisted living, Tele-consultations).
- Productivity tools which improve efficiency and availability (e.g. Electronic health records, Professional communication).

TELEHEALTH

Telehealth (telemedicine) is a health delivery system which refers to the exchange of medical information between two sites via electronic communications in order to improve a patient's health status. Telehealth includes a growing range of applications and services using two-way video telephony, wireless tools and networks, emails, smart devices, Internet and cloud services and infrastructures, and other forms of telecommunications technology. Clinical telemedicine practice supported by video conferencing, medical connectivity through m-health, remote patient monitoring, disease management, home treatment, continuing medical education, medical call centers, are all considered part of telemedicine and telehealth. Health professionals providing telehealth services should have the continuing education, training, licensure, in order to acquire the necessary knowledge and competencies needed to provide safe and high-quality telehealth services.

Figure 2 shows the projected compound annual growth rate (CAGR) for the global digital health market from 2013 to 2020, by segment. During this

Figure 2. Projected CAGR for the global digital health market from 2013 to 2020, by segment. Source: (Statistic, n.d.).

period, the telehealth market's compound annual growth rate is expected to be around 46 percent. The digital health market is expected to reach 233.3 billion US dollars by 2020 (Statistic, n.d.).

TECHNICAL REQUIREMENTS FOR REAL-TIME INTERACTIVE SESSIONS

The quality of a video healthcare interactive session primarily depends on the characteristics of the network connection between the conferencing sites. The H.323 standard specifies the components, protocols, and procedures for the transmission of real-time audio, video, and data communications over IP (Internet Protocol), i.e. packet-based, networks. In the case of H.323, a high-quality conference, which implies excellent audio and video, needs from 768 kbps (kilobits/second) to 2 Mbps (megabits/second) in each of the downlinks and uplink directions.

In the case of "Point to point video conferencing", two H.323 video conferencing systems communicate to each other over the Internet. One station initiates the call, and the other either accepts or rejects it. Once accepted, encoded and compressed audio and video flow between the two stations. In the case of "Multipoint video conferencing" more than two sites communicate with each other. In the H.320/ISDN world, a Multipoint Control Unit (MCU) was used. This allowed three or more user stations to connect to the MCU. In the case of the voice switching mode, the MCU made a decision about which site was currently talking. Smartphones and tablets (such as iPhones and iPads) do support live conferences; however, 3G/4G/LTE/WiFi connections are not sufficiently reliable for participating in online sessions. It is highly recommended to use a computer with a wired internet connection. In the case of high-quality (HQ) resolution, 640x360@15, 30 fps (frame per second) is recommended, but in the case of full High Definition resolution (FHD), 1920x1080 30 fps is recommended. Graphical

cards must be compatible with DirectX 10.0, from 512MB (min. NVidia 8600 GS, Radeon HD 2600 XT, Intel HD Graphics 2000) to 2GB (min. NVidia GT640, AMD Radeon HD 6670, Intel HD Graphics 4000).

Minimum system requirements for conference hosts are: Windows XP 32 bit or Windows 7 (32bit or 64bit); Core2 Quad, Intel i3, i5 or i7 equivalent CPU; 4 GB of RAM; 100 MB of available HDD space (additional space recommended for conference recording features); 100 MB NIC or higher; High speed broadband Internet access (at least 1 Mbps upstream and 4 Mbps downstream); DirectX 9.1 or later compatible webcam; DirectSound compatible audio input and headset or speakers (Video Conferencing System Requirements (n.d.), Web & Multiparty Video Conferencing System Requirements (n.d.), VCI-Next Generation Video Conferencing (n.d.)).

The video conference software should be able to adapt to changing bandwidth environments without losing the connection. Health organizations should have the appropriate redundant systems in a place that ensures availability of the data transmission infrastructure for critical connectivity.

DIGITAL TRANSFORMATIONS IN MEDICINE

mHealth has the potential for use in the following areas:

- Education and training of healthcare workers;
- Remote data collection and remote monitoring;
- Remote diagnostic and treatment support.

The main advantages brought by the concept of mHealth imply the increase in the quality of health care while creating new opportunities on the one hand, and reduced costs on the other hand. About 75% of patients suffer from chronic diseases (high blood pressure, diabetes, heart

disease, cancer, etc.). Using mHealth solutions, the biomarkers of these chronic patients can be monitored ensuring the quality management of their diseases in order to improve the quality of their life. These technologies exist and have been adopted, and their examples are the wireless Halter monitors, weight scales, blood pressure cuffs and glucometers (Malvey et al., 2014).

In order to be cost-effective and commercially-sustainable for the mass-market, mobile health services should be standardized. One of the problems is that today there is not an organization in the world which deals with the standards in the field of mHealth. For example, the International Standards Organization (ISO) has developed standards (IEEE 11073) for the transmission of blood pressure in a basic binary data format between two low-level devices, which can be transferred into a human-readable format using health messaging standards, such as HL7 (Engineering in Medicine and Biology Society, n.d.).

Some of the mHealth categories (Applications and Devices) are Nutrition Application, Glucometers, Biometrics devices, Sleep Trackers Applications and devices, Tobacco Cessation Applications and Programs, Medication Adherence Devices and so on (Validic, n.d.).

Some examples of the use of medical sensors are as follows: the sensors can help detect, and thus avoid, about 5000.00 known viruses that cause serious illness around the world. Biochemical sensors can continuously scan a billion miles long chain of Deoxyribonucleic acid (DNA) and look for changes and potential diseases. Taking into account the fact that the human heart throughout a life pumps about 15 million gallons of blood, cardiac sensors or heart rhythm sensors can provide information about how efficiently a heart works. The human brain has about 100 billion neurons. Gum sensors have the preventive effect on the development of other diseases in the organism because people who suffer from a gum disease represent 50% of those who are predisposed to suffer brain and heart attacks. New sensors can detect a high level of blood sugar without draw-

ing blood. By using an ultra-sensitive sensor to detect the presence of tumors and early abnormal cell growth, cancer can be recognized at an early stage and thus effectively treated. Biosensors may provide insights into disease processes that are hard to detect directly, such as dysfunctions in brain chemistry that are thought to play an important role in many mental disorders (Health Sensing Infographic, 2014; Sensors, n.d.).

The next generation of IoT quantified tracking devices falls into the category of wearable electronics and multi-sensor platforms. These products include smart watches, wristband sensors, wearable sensor patches, artificial reality-augmented glasses, brain-computer interfaces, wearable body metric textiles.

Other important categories include smartphone applications and their enhancements, and environmental monitoring and home automation sensors.

For example, Hexoskin products give insight into the physical training, sleep, and personal daily activities:

- Track heart rate and view real-time ECG with great precision.
- Heart rate variability (HRV) is an essential tool to measure stress and training fatigue to avoid overtraining.
- Breathing rate in order to control own breathing, increase performance and reduce stress.
- Breathing volume in order to control lung capacity for each of daily activities and avoid hyperventilation and apnea.
- Sleep tracking device in order to measure resting heart rate, breathing, and sleep positions.

CONCLUSION

The advances in science, technology, engineering, and medicine will allow the use of sophisticated sensor technologies in the further medical research that could drastically improve the quality

of life of people, particularly people with serious disabilities. Also, technological advancement in the healthcare area revolves around the following outcomes: improved access to care, increased care quality and reduced care costs. At the end, we can conclude that the technological The Internet of Things is potentially disruptive because global society, global economy and governments are unprepared for a possible future when the Internet nodes will be able to remotely control, locate, and monitor everyday things. Having in mind that everyday objects become information security risks, the IoT could distribute those risks far more widely than the Internet has to date.

FUTURE RESEARCH DIRECTIONS

Generally, the next Internet revolution will be the interconnection between everyday existing objects in order to create a smart grid and intelligent environment. The future application of technology in health care will lead to the creation of an entirely new level of personalized, digital health care, where everyone is responsible for monitoring their own health and the quality of their own life. Further research is aimed at improving the existing sensors through increasing their capabilities and enhancing their efficiency. In the coming period, IoT is expected to play the key roles in all the aspects of modern medical treatment and health management - prevention, diagnosis, disease monitoring, treatment monitoring.

KEY TERMS AND DEFINITIONS

Body Area Network: A network that can collect information about an individual's health, fitness, and energy expenditure.

Health Care Monitoring: The medical applications can be of two types: wearable and implanted. Wearable devices are used on the body surface of a human or just at a close proximity of the user. The implantable medical devices are those that are inserted into the human body.

Health Informatics (Healthcare Information Systems): Software solutions for appointment scheduling, patients' data management, work schedule management and other administrative tasks regarding health.

Internet of Things (IoT): A new concept that has emerged thanks to the development of new technologies, especially the Internet Technologies and Wireless Sensor Networks that together enable the existence of the health system at the global level.

Mobile Health (mHealth): A collection of mobile technologies as tools and platforms for health research and healthcare provision.

Sensor Network: A network that consists of multiple detection stations called sensor nodes, each of which is small, lightweight and portable.

Sensor Node: A node in a sensor network that is capable of performing some processing, gathering sensory information and communicating with other nodes connected to the network. The main components of a sensor node are a microcontroller, transceiver, external memory, power source and one or more sensors.

Telemedicine: A physical and psychological diagnosis and treatment at a distance, including telemonitoring of patients' functions.

Wireless Sensor Networks (WSN): A network that consists of spatially distributed autonomous sensors used to monitor physical or environmental conditions, and to forward their data jointly to the main location through the network.

Maintenance Policies Optimization of Medical Equipment in a Health Care Organization

INTRODUCTION

For a long period of time, maintenance has only focused on repairing breakdowns occurring in the machines as a result of its production. Maintenance policies has not been extensively analyzed and implemented in the actual companies; this aspect has been taken more into account in manufacturing companies than in service ones, where the maintenance was considered a department without influence on the service final quality (Gómez, Ruiz de la Hermosa, & Carnero, 2009). The concept of maintenance has evolved to be considered as a productive activity of the organization, since the correct operation of the equipment ensures the availability of production.

In a healthcare organization, the electromedical service is the department responsible for maintaining the entire healthcare equipment and specific facilities that cover the center, as well as its management through inventory control. It is essential that all medical equipment is properly maintained to ensure the highest level of availability and reliability. It is also important to have a maintenance strategy in which the maintenance policies are defined in order to keep track of medical equipment and to give priority to those required on critical

operations (Jamshidi, Abbasgholizadeh Rahimi, Ait-kadi, & Ruiz, 2015).

The aim of this chapter is to minimize the corrective breakdowns produced in the electro-medical equipment of a healthcare organization. To this, an optimization plan of maintenance policies will be developed in the equipment that needs it. The objective pursued is to increase scheduled preventive maintenance shutdowns carried out by Electromedical Department and to reduce the corrective maintenance. This plan includes the creation of preventive maintenance datasheets in which the activities undertaken, the periodicity, the estimated time to do the activity, etc. are identified.

The data used in this research has been obtained from the Computerized Maintenance Management System (CMMS) owned by the healthcare organization. Different types of rankings have been made in the stocks to prioritize items by family of equipment and by average work orders (WOs) by equipment generated. According to this analysis, the maintenance tasks are optimized to preserve the satisfactory working conditions and the performance of equipment in the healthcare organization optimizing available resources. All of this is intended to anticipate the maintenance

DOI: 10.4018/978-1-5225-2255-3.ch321

activity to breakdowns and to prevent the care quality from diminishing by increasing the patient waiting time by unavailability of medical equipment in the treatments and diagnostic tests.

The structure of this chapter is as follows. Next section draws a literature review where the concept of overall maintenance and maintenance of electromedical equipment in particular is detailed. Also, the ABC analysis is defined. Then, a general description of the healthcare center in which the study is carried out, an example of instruction datasheet and the analysis undertaken is done. The results obtained are shown below. Later, the conclusion of the research is presented. Finally, the references, additional readings and key terms used are shown.

BACKGROUND

For a long time, maintenance has been understood as part of the work that encompassed only the repairing breakdowns occurring in the machines and therefore, the employer included it as an economic burden to bear. However, this concept has progressively evolved over time until nowadays that is considered as a productive activity of the organization. Therefore, the role of maintenance has gained great interest and importance. Improving maintenance in a company is seen as an investment that will have a positive impact on quality and availability of the product as well as on productivity of the organization (Alrabghi & Tiwari, 2016).

It is common to consider in literature (see Dekker, 1996; Scarf, 1997; Eti, Ogaji, & Probert, 2006; and Hamdi, Oweis, Zraiq, & Sammour, 2012), that maintenance is the function responsible for ensuring availability of equipment and machines of a company; that is, it is associated with a set of actions that aim at preserving the assets (equipment and facilities) of the company during the period of useful life of these. Based on the criteria developed by cited authors above, the definition of maintenance is set as the range

of activities performed to a system, equipment or component to ensure that it continues to perform desired functions within an operational context given at the lowest possible cost. The main objective is to preserve its function, good operating conditions, to optimize performance and to increase the useful life, by ensuring optimal investment of resources.

Maintenance management includes all activities that determine the objectives, strategies, maintenance responsibilities and the implementation of all these. There are several significant factors to take into account to carry out an adequate management such as the importance and criticality equipment, the cost, the reliability and security, the environmental impact, etc. (Carnero & Gómez, 2016).

Maintenance department should have a software called Computerized Maintenance Management System (CMMS) to manage the maintenance of all equipment and facilities of a company, which incorporates a database and facilitates maintenance management with scheduling tasks to be performed by the maintenance department. This way, it will be possible to have a real time control of the whole system. This tool helps plan and manage the necessary functions to achieve an effective maintenance (Gulati & Smith, 2009).

Three basic kinds of maintenance policies are defined depending on the moment in time in which they are made, the purpose for which they are implemented and the resources used:

1. **Corrective Maintenance:** Performed activities to repair equipment when a failure appears (Carnero, 2009).
2. **Preventive Maintenance:** Scheduled actions which are performed while the system is running in order to keep it available and improve their conditions to avoid unpredicted failures (Doostparast, Kolahan, & Doostparast, 2014).
3. **Predictive Maintenance:** Actions that predicts system failure before it happens. The

purpose is to mitigate the failures looking for the underlying causes, and thus reduce the cost incurred by corrective maintenance (Faiz & Edirisinghe, 2009).

Particularly, medical equipment is essential in the prevention, diagnosis, and treatment of illness, as well as patient rehabilitation in hospitals (Noor, Magray, & Chawla, 2016). Electromedical equipment maintenance in a healthcare organization includes all equipment and high level of technology facilities in any field in bioengineering (Gómez, 2013) for instance: capturing and processing images of high level of digital resolution techniques, diagnosis and treatment with radioactive isotopes, conventional and laser surgical techniques, obtainment analytical techniques by robotized chains, cryogenic systems, precision mechanics, microscopy, with highly advanced components and advanced control systems.

Maintenance management in hospitals is much more complex than other manufacturing organizations, for it undertakes medical and health responsibilities that deal with the patient's life (Sadaghiyani, 1998). Moreover, there are a large amount of medical devices with high technology. For these reasons, it must be incorporated an excellent management tool to classify all equipment effectively.

The ABC analysis allows the classification of items according to their importance. It is based on the application of the Pareto principle, also known as 80-20 rule according to which, about 80% of the effect come from 20% of the main causes (Koch, 1998). This technique is the most commonly used in inventory management to categorize a large number of articles into three ordered and predefined groups: group A includes the very important items, group B contains the moderately significant pieces and category C includes the relatively insignificant items (Douissa & Jabeur, 2016).

This tool can be used in a lots of applications. If applied to the maintenance of electromedical equipment, machines can be divided into 3 groups:

- **Group A:** It includes approximately 10-20% of total machines, but accounts for 60-80% of the total maintenance cost.
- **Group B:** It constitutes about 30-40% of equipment and account for 20-30% of the total maintenance cost.
- **Group C:** A numerous groups of machines around 50-60% represent only 5-10% of the total maintenance cost.

The really important are groups A and C since they provide information about a few medical devices that are significant and a large number of machines that are relatively insignificant. The percentage may vary depending on the case. The objective of this technique is to manage in an effective way a maintenance management program by determining which equipment is more important to keep available.

HOSPITAL DESCRIPTION

Medical equipment of a new generation hospital is analyzed. Equipment and facilities of all branches of bioengineering such as different capturing and processing images techniques, diagnosis and treatment with radioactive isotopes, conventional and laser surgical techniques, obtainment analytical techniques, cryogenic systems, precision mechanics, microscopy and generally, equipment with latest generation components are included.

The hospital has the following services (Gómez, 2013): 540 hospital beds, 17 oncohaematological outpatient care stations, 28 dialysis stations, surgical and obstetrical wing, Intensive Care Unit (ICU), emergency department, nuclear medicine, radiation therapy, physical therapy and 119 out-

patient visits. It also has support services such as laboratories, blood bank and hospital pharmacy.

PREVENTIVE MAINTENANCE DATASHEETS

In order to reduce the corrective maintenance, preventive maintenance datasheets are created, in which the activities undertaken, the periodicity, the estimated time to do the activity, etc. are identified. Using preventive maintenance datasheets, apart from meeting the recommended safety parameters for each family of electromedical equipment, aims to reduce corrective maintenance. Such approach shows the most optimal and suitable for health care center facilities because if it is a serious breakdown to stop a service for a long time, it may be a decrease in care quality by increasing the patient waiting time. Moreover, it is cost-effective to replace a worn component of a machine when it is detected in a preventive maintenance review than having to repair if a catastrophic failure occurs, since these often induce failures in other components of medical equipment.

Preventive Maintenance Datasheets of Electrosurgical Equipment

H

An example of the content included in a preventive maintenance datasheets of electrosurgical electro-medical equipment developed is showed below. The datasheet consists of the following sections:

1. General test
2. Leakage test
3. Power test
4. Frequency test
5. Electrical safety

Also, the measurement devices used, the name and signature of the technician and the date are included in all preventive maintenance datasheets.

All instruction datasheets have been made following the specific electromedical equipment regulation. When the appropriate preventive maintenance has been performed, each maintenance technician must fill in the datasheet. Figure 1 and Figure 2 shown the electrosurgical datasheet template.

ELECTROMEDICAL EQUIPMENT ANALYSIS

In order to establish a ranking according to the impact regarding the preventive maintenance work orders that are produced, two analyses have been made that encompass 187 electromedical equipment belong to the healthcare center. Two rankings are established under Pareto principle are:

1. By work orders by family of equipment.
2. By average work orders by equipment.

According to Pareto analysis, Table 1 and Table 2 show the results included in A category of first and second ranking respectively. All equipment is not shown because of a lack of space.

A simply method of classification is considered to get successful results. The key of this arrangement is that while there is not used a creative contribution, it is a tool that works efficiently. In other

words, it consists in ensuring that electromedical equipment are ranked in order of importance in a suitable manner.

SOLUTIONS AND RECOMENDATIONS

The following results have been achieved in the ABC analysis. In the first ranking, the result obtained is that 20.32% of the family of medical equipment accounts for 68.71% of work orders whereas in the second case, 20.32% of the medical equipment accounts for 47.01% of work orders.

The first analysis is classified according to the highest work orders irrespective of included equipment, whereas in the second, they are taken into consideration. In other words, in the first study, equipment that has many WOs and a large number of equipment are at the top for not taking into account the number of equipment while after

Table 1. ABC by family of medical equipment

Code	Equipment Description	Number of Devices	% System Accumulated	N° WO Family	% Wo Accumulated by Family

Figure 3. ABC graph by family of medical equipment

Source: (Own elaboration, 2016)

making the second analysis, the ranking position decreased because WOs by equipment are reduced. Figures 3 and 4 illustrate this.

In line with this classification, the first 38 families of medical equipment that set up Pareto which produce the most WOs have been examined in order to optimize the Preventive Maintenance Plan as well as to achieve the objective of diminishing breakdowns, that is to say, smaller corrective work orders.

The following stages have been carried out:

Step 1: Identification of breakdowns:

- Number.
- Cause (failure mode).

Step 2: Establishment of overall conclusions taking into account several aspects:

- Repetitive failures linked to badly use on the part of the user. Design training activities for those responsible for the services involved. Training action plan.

- Repetitive failures due to normal use. Identification of tasks and the frequency to be implemented in the range of preventive maintenance to be created for reducing the repetition of this failure mode.

Some examples are shown below.

Neonatal Incubator

Device whose function is to create an environmental with humidity, temperature and oxygen concentration suitable for growth of neonates.

Step 1: Identification of breakdowns: fan breakdowns.

- **Number:** 5 WOs are produced (20% of total failures).
- **Cause - Misplacement of the Fan:** Damping spring adjustment or bearings lubrication.

Step 2: Established findings:

Figure 4. ABC graph by average work orders by medical equipment

Source: (Own elaboration, 2016)

- Training guide or video to install correctly the fan.
- Preventive maintenance (operation to include in the existing range):
 - **Visual Review:** Determine if there are problems that can apparently be detected and the lack or the loss of accessories that are part of equipment as signs of short or damages.
 - **Cleaning:** Clean at least some parts and equipment surfaces, using suitable cleaning compounds for each of them.
 - **Test Runs:** Check that the equipment are completely operational within the specific limits with in the implementation of the software auto-test.

Electrosurgical

Electrosurgical device based on electronic technology be able to produce a given set of high

frequency electromagnetic waves for the support of remove or cut soft tissue.

Step 1: Identification of breakdowns: damage in the bipolar forceps cable and failures due to performance reviews.

- **Number:** 6 WOs are produced (24% of total failures) and 7 WOs (28% of total failures) respectively.
- **Cause:** Part failure and misuse.

Step 2: Established findings:

- Implementation of a daily protocol review by the user to avoid performance reviews in which no action is taken.
- Preventive maintenance:
 - **External Cleaning:** To keep equipment clean.
 - **Connector and Electronic Boards:** Dirt accumulation on the boards produce breakdowns so they must be kept clean. Ensure that all connector are properly connected.

Multi-Parameter Monitor

Equipment for the simultaneous display of different biological patient parameter such as electrocardiogram, arrhythmia analysis, cardiac output, blood pressure, breathing, blood oxygen saturation, etc.

Step 1: Identification of breakdowns: failures in non-invasive blood pressure cuffs and in the sensors.

- **Number:** 4 WOs are produced (18.18% of total failures).
- **Cause:** Break of sensors or cuffs and imbalance of parameters. They have no review protocol. Failures due to the user.

Step 2: Established finding:

- Implementation of a daily protocol review by the user to avoid performance reviews in which no action is taken.

RX Emergency Room

Equipment for a non-invasive medical test used to diagnose and treat medical conditions. Imaging with x-rays implicates exposing a part of the body to a small amount of ionizing radiation to produce images of the inside of the body.

Step 1: Identification of breakdowns: Breakdowns on the grid to filter the radiation produced (Bucky).

- **Number:** 6 WOs are produced (33.33% of total failures).
- **Cause:** Inappropriate way of working with the equipment producing an imbalance in the Bucky drive mechanism

Step 2: Established finding:

- Implementing a training program about the way of working with the system.

- Analyze failures next year to assess whether problems in the Bucky continue to exist. Thus, the origin must be identified and the problem solved.

FUTURE RESEARCH DIRECTIONS

According to this analysis, apart from achieve an increasing patient satisfaction by decreasing waiting times, a continuous improvement in the control and management of maintenance will be accomplished. In future research, it should be checked that benefits have been obtained and for the following years, similar studies will be performed in order to update the examination and to implement a continuous improvement process. Also, due to the medical technological renewal current rate, it has become necessary to update analysis with new family of medical equipment that are being introduced into hospital.

In short, all of this is intended to optimize maintenance policies of electromedical equipment belonging to the hospital. As a result, it is expected to get a reduction of corrective activities, just as substantial improvement in the effective use of resources by electromedical department.

CONCLUSION

An ABC analysis of electromedical equipment in a healthcare organization has been performed to introduce a preventive maintenance ranges in the equipment that need it. Daily maintenance tasks that minimize unscheduled shutdowns have been generated. This will greatly improve available resources in electromedical department. A healthcare organization has large amount of maintenances requirements for the electromedical facilities because of the equipment are used directly with patients. For this, it is important improvement maintenance policies carried out by the workers. This straightforward investigation

will help the maintenance department in order to achieve this aim.

The maintenance control in a healthcare center is essential to carry out maintenance tasks optimizing resources without negatively affecting care quality. The issue of optimizing maintenance policies in healthcare organizations is not well known, thus, there are almost non-existent contributions. Applying this new analysis, in addition to achieving increased patient satisfaction, an improved management and control of maintenance will be accomplished.

ACKNOWLEDGMENT

KEY TERMS AND DEFINITIONS

ABC Analysis: Rating method based on Pareto principle. In maintenance of equipment, allows to identify items depending on generated impact and divide them into three group to establish an order of priorities when managing maintenance.

Computerized Maintenance Management System (CMMS): A software package which manages resources of maintenance department, incorporating a database continuously updated. It allows to schedule preventive, corrective and predictive maintenance tasks.

Electromedical Department: Technical service department whose activity includes total maintenance of medical equipment in a healthcare organization and specific facilities which provide coverage the same, as well as management through the inventory unit responsible for updating existing equipment.

Electromedical Equipment: Equipment and facilities belonging to a healthcare organization.

Healthcare Organization: Center that provides health services such as diagnosis of diseases, surgical operations and treatment and recovery of patients. Also, research and teaching assignments can be performed.

Maintenance Datasheet: Document which specifies preventive maintenance activities that are required to minimize corrective maintenance of electromedical equipment to comply with safety parameters.

Maintenance: A set of actions responsible for ensuring machines and production equipment availability in a company.

Work Orders (WOs): Generated document when a failure of any equipment occurs in order to achieve maintenance tasks to solve the problem.

The Optimal Workforce Staffing Solutions With Random Patient Demand in Healthcare Settings

Alexander Kolker
GE Healthcare, USA

INTRODUCTION

The current demand for more efficient use of healthcare resources, cost reduction, and patient safety improvement stimulates developing the novel operations management solutions. Workforce management has emerged as the one with the biggest impact on cost efficiency and quality of care in the USA. Indeed, labor cost typically absorbs about 54% of total hospital's operating revenue (Herman, 2013). Therefore, an accurate assessment of the required staffing that matches the highly variable patient demand is an integral part of the hospital's budgeting and planning process. Healthcare administrators must accomplish multiple clinical and quality goals while simultaneously developing realistic staffing plans and budgets. Random fluctuations of patient demand present staffing planning challenges to many hospitals. There is a growing trend for using data analytics to address these challenges.

The objective of this chapter is providing an overview and examples of application of the data analytics methodology called the "newsvendor" framework. This methodology helps to determine the optimal staffing solutions for the specified time periods for hospital units with randomly fluctuating daily patient census.

BACKGROUND

The newsvendor model is the widely used analytic model in which the optimal inventory level is determined for a specified time period. Historically, it originates from the problem in which a newsvendor has to decide on the optimal stocking quantity of the newspaper (a single product) to be ordered from the publisher in some defined ahead time period; hence it is called the newsvendor problem. If too many issues are ordered there will be some financial loss due to unsold inventory. If not enough issues are ordered there will also be some financial loss due to unmet customer demand. The problem is determining the optimal quantity order that will minimize the total financial loss due to both over- and understock during some time period.

The newsvendor framework has been widely applied to problems in which decisions should be made on the fixed supply level with an uncertain (random) demand. Such problems are often occurring in supply chain management, retail, transportation, manufacturing, banking, and many other industries (Choi, 2012; Arikan, 2011; Porteus, 2002). Motivated by the importance of various practical applications of the newsvendor model, the entire special issue of the Decision Sciences journal (Chen et al., 2016), and the review paper (Qin et al., 2011) were dedicated to its novel advances and applications.

At the same time, the use of the newsvendor framework was rather limited in healthcare management for planning and budgeting the hospital units' staffing while patient demand is uncertain.

For example, in the handbook of newsvendor problems, which is the first handbook dedicated exclusively to the state of the art in this area (Choi, 2012), the optimal nursing staffing problem with uncertain patient demand was not presented at all. However, this is a fruitful area of application of the newsvendor framework. The long-term nursing staffing plans should be developed on the annual basis. The medium-term staffing plans should usually be developed for a 4-6 weeks period, and be posted 1-2 weeks before the start of the planned period. Because of inevitable occurrences of unforeseen deviations from the planned staffing level, some short-term staffing adjustments should be made shortly before each shift to determine whether overtime, pooled or agency nurses are needed, or if the unit is overstaffed and some nurses are not currently needed. There is a cost associated with flexing staff up or down, along with issues of staff dissatisfaction with the erratic unpredictable schedules. There is an empirical evidence that the frequent staffing adjustments costs are accumulated to significant amounts that were not previously budgeted for. The optimal staffing level determined by the newsvendor model minimizes these accumulated costs, thus making nursing staffing plans and budgets more realistic.

One of a few publications that mention the use of the newsvendor framework for determining the optimal nursing staffing level is Hopp and Lovejoy (2013). These authors included the newsvendor framework as one of the management principles: in a single time period (month, quarter, or year) with uncertain staffing demand, the staffing level which corresponds to the minimal (optimal) possible total cost of under- and overstaffing is given by the solution, S , of equation

$$F(S) = Cu / (Cu + Co) \quad (1)$$

where $F(S)$ is the cumulative distribution function of staffing demand, Cu and Co are the hourly costs of under- and overstaffing per nurse, respectively. Derivation of Equation 1 is given in Appendix.

These authors assumed that staffing demand in any single time period is normally distributed with the known mean, m , and standard deviation, σ . Therefore, the optimal staffing level S is given by $S = m + Z * \sigma$, where Z is the inverse standard cumulative normal distribution function, i.e. $Z = \Phi^{-1}[Cu / (Cu + Co)]$.

At the same time, the assumption of normal staffing demand distribution is rarely true (if ever). Staffing demand is usually a skewed distribution function that poorly fits any theoretical distribution. This is pointed out by Davis et al. (2014) in which the newsvendor framework is applied for analyzing nursing staffing under demand uncertainty. The authors propose the use of distributional robust formulations of the newsvendor problem suggested by Perakis et al. (2008). In this formulation, it is sufficient to know only the moments of the demand distribution. However, the closed-form solutions to these models are not available. The authors propose to solve those using linear programming for sub-problems.

One important condition for application of the classic newsvendor framework is that the staffing distribution function must be stable and applicable both for the current and for the future time periods. This requires forecasting the demand which is itself a separate challenging problem. Usually, the demand forecast generated, for example, by a time series analysis can be reasonably accurate only for about a week or so. Beyond that time horizon, the forecasting errors are similar to that coming simply from the historical demand distributions (Davis et al., 2014). It is quite restrictive to assume that the future demand distribution is well known. Therefore, there have been some efforts to relax this assumption. One direction has been the nonparametric (data-driven) approach. In this approach, independent past demand data are used to estimate the minimal number of ob-

servations required for the estimated solution to be near-optimal. Rudin et al. (2013) applied this approach to estimate the optimal nursing staffing in a hospital emergency room. The authors investigated the newsvendor problem with past demand observations and a number of features to predict the future demand, such as the day of the week, time of the day and the number of past demands. This setting is similar to He et al. (2012) who considered staffing in a hospital operating room with two features (number and type of cases) to predict the required OR time.

However, selecting the right features is not easy and requires multiple models' cross-validations for testing the predictive power of the chosen features. Regardless of the sophistication of the prediction technique, if a sudden rare one-time event occurs such as mass casualty or a large epidemic outbreak that could not be previously accounted for, such an event would result in significant bias in the optimal staffing level.

There are several software products commercially available that facilitate daily staffing planning and management, such as McKesson ANSOS One-Staff, Kronos Workforce Scheduler, API/GE Healthcare Staffing & Scheduling, Cerner Clairvia Care Value Management Scheduling, among others. None of them offer predictive data analytics capability that foretells the optimum staffing level and the costs of deviation from that level that the newsvendor framework is providing.

Note that no popular nowadays machine learning algorithms will improve the solution proven as mathematically optimal. The term 'optimal' means that the staffing solution provides the minimal possible total cost of under- and overstaffing occurrences compared to any other staffing values within these time periods.

In the next sections, examples are provided in which the optimal workforce staffing solutions are determined using the newsvendor framework. In these examples, empirical staffing cumulative distribution functions (ECDF) are used, and Equation 1 is solved numerically assuming that the staffing demand is a random sample from a stable

but unknown distribution. Numerical solutions are produced using a computational procedure that was built in the excel spreadsheet. In contrast to the previous research, no best fit theoretical staffing distribution functions, or distribution moments or any other special information on the staffing distribution is needed.

MAIN FOCUS

Method

Implementation of the newsvendor framework includes the following steps: (i) variable patient census is converted into the corresponding variable staffing demand for a specified time period, (ii) the staffing demand is converted into the staffing empirical cumulative distribution function (ECDF), (iii) the cost ratio is calculated $r = Cu / (Cu + Co)$ using the hourly costs of under- (Cu) and overstaffing (Co) per nurse, and (iv) steps (ii) and (iii) are combined to solve Equation 1 numerically using a computational procedure described below.

Conversion Variable Patient Census Into Variable Staffing Demand

Conversion the variable patient census into variable nursing staffing can be performed using: 1) established patient-to-nurse ratio (PNR) that takes or does not take into account the patient acuity levels, or 2) hours per patient day benchmark standards or the calculated hours of care from the patient classification system (PCS), or 3) a staffing grid indicating for each census range the number of each caregiver skill for each shift.

1. **The Use of Patient-To-Nurse Ratio (PNR):** To illustrate, daily midnight census data for a medical-surgical unit is presented on Figure 1 for the entire year to account for some seasonal census variation. Three levels of PNRs were established in this unit. Typically,

28% of patients with the high acuity level require PNR 1:1; 67% of patients with the medium acuity level require PNR 2:1, and 5% of patients with low acuity level require PNR 3:1 (These percentages vary seasonally but are kept fixed here for simplicity. Other nursing units can have different acuity percentages and PNRs). Each census value was multiplied by the weighted sum of inverted PNR values to convert it to the corresponding staffing, i.e. $\text{staffing} = \text{census} * (0.28/1 + 0.67/2 + 0.05/3)$. Results are presented on Figure 1 (upper panel). Note

that dividing each census value by the average $\text{PNR} = (0.28*1 + 0.67*2 + 0.05*3) = 1.77$ is not correct because dividing by the average is a non-linear operation that produces a biased staffing value. (Dividing census by PNR would be correct if PNR is an exact number, not the average).

2. **The Use of Patient Classification System (PCS):** In general, PCS is a system that quantifies categories of care in order to estimate the required nursing hours for direct patient care (Malloch et al., 2013). PCS-generated hours of care for each patient are summed

Figure 1. Annual daily census and the corresponding staffing

up, and the sum is then divided by the shift length hours. This gives the required staffing for the particular period. An example of the variable staffing generated by the PCS is presented, for comparison, on Figure 1 for the same daily midnight census used for the above PNR example (middle panel).

3. **The Use of the Staffing Grid:** A staffing grid reflects the perceived nursing workload by the nursing management. It is usually budget target based, and serve as a baseline guide. The skills and competency of the staff is also a consideration. An example of a simplified staffing grid for a medical-surgical unit is presented in Table 1.

An example of the variable staffing generated by this grid is presented, for the comparison, on Figure 1 for the same daily midnight census used for the above examples (bottom panel). Notice that the required staffing generated by the grid is less sensitive to census variation because the staffing levels stay constant within each patient census range.

Conversion of Staffing Demand Into the Empirical Cumulative Distribution Function (ECDF)

If a random set of n data points $S_1, S_2, \dots, S_n$ contains m data points that are less than or equal to some value S_k , then ECDF $F_k(S)$ is defined as the fraction m/n . The ECDF is calculated using the rule:

$$F_k(S) = \begin{cases} 0, & \text{if } S_k < S_{min} \\ m/n, & \text{if } S_{min} \leq S_k \leq S_{max}, k = 1, 2, \dots \\ 1, & \text{if } S_k > S_{max} \end{cases}$$

To illustrate, consider required staffing values presented on Figure 1 (upper panel). They range from $S_{min}=14$ to $S_{max}=28$. The sample size is $n = 364$ data points. The ECDF for these values is presented on Figure 2. The ECDF is not usually a smooth analytic function. In general, ECDF poorly fits the common theoretical distributions.

The Hourly Costs of Under- and Overstaffing Per Nurse and the Cost Ratio

If too few nurses are planned and staffed vs. the actual nursing demand (understaffing case), then the additional nurses can be called on from the internal float pool at no extra cost (if a trained nurse is available), or from the off-duty nursing pool, or a staffing agency at a premium above the base pay rate.

To illustrate, suppose that a trained nurse is available in the internal pool 50% of time. Hence, a nurse from a staffing agency should be called on 50% of time. The premium above the base pay is 150%. Thus, the additional cost per called-on nurse in excess to the base pay rate

$$P(\$/hour) \text{ is } Cu = (1-0.5) * 1.5 * P(\$/hour) = 0.75 * P$$

If too many nurses are staffed (overstaffing), then the extra nurses can be called-off either into the internal float nursing pool or offered to take paid/unpaid vacation or put on call. If the nurse is put on call then she/he is not usually get payed (in majority USA hospitals). This makes an impression that calling-off a nurse does not cost anything (except the case for contractual obligation to pay

Table 1. A simplified staffing grid for the Medical-Surgical unit

Patient Census Range	Nursing Staffing
<24	10
24-28	13
29-35	17
36-40	19
41-44	21
>44	24

Figure 2. ECDF for variable staffing: The dotted lines illustrate the graphical solution of Equation 1

for putting on call, if any). Hence, the unit always has a financial incentive to staff to the maximum. While this might be true for the unit's base payroll, there is a fixed cost for the called-off nurse. KPMG reported (KPMG, 2011) that the average nursing hourly costs in the USA is about $P=\$45/\text{hour}$. This includes the base payroll cost of $\$35/\text{hour}$, and the total of insurance, recruiting, training and other costs per nurse of about $\$10\text{-}11/\text{hour}$, on average. Therefore, even if the called-off nurse is not get paid through the unit's payroll, she/he still costs the hospital about 22%-24% of the base pay, i.e. $0.24 \cdot P(\$/\text{hour})$, but brings no patient care value. Using this fixed cost of overstaffing, the cost ratio is $r=0.75/(0.75+0.24)=0.76$. Notice that the base pay rate is cancelled out in this ratio.

In most cases, the understaffing costs more than the overstaffing. Therefore, usually $r>0.5$. In rare cases of the same under- and overstaffing costs, $r=0.5$.

Note that an approach was suggested in which the cost parameters C_o and C_u were imputed from the observed actual staffing rather than treated as

the model inputs (Olivares et al., 2008). However, this approach assumes that the actual staffing was already close to the optimal. Otherwise, the imputed cost parameters will be significantly biased.

Computational Procedure for Solving Equation 1

Solution of Equation 1 is the staffing value, S , for which $F(S)$ is equal to r . It is illustrated graphically on Figure 2 by dotted lines for $r=0.76$. The optimal staffing solution is 24.5. This value can be fractional because, in general, staffing is expressed by FTE (full-time-equivalent) which is not necessarily a whole number. One FTE is usually 40 hours per week. For staffing software, Equation 1 should be solved numerically. A simple computational procedure for doing so is the following:

1. Make the FTE bins from minimal to maximal staffing values with the increment 0.25 FTE. (From a practical standpoint it is usually enough to get the staffing solution accuracy

+/- 0.125 FTE. Hence, 0.25 FTE staffing increment is usually suffice).

2. For each incremented FTE value S test if the corresponding ECDF value $F(S) < r$. If this condition is TRUE then go to the next value of $F(S)$, and so on.
3. 3. If $F(S) \geq r$ then STOP. The optimal staffing will approximately be the mean value

$$S_{opt} = [\text{FTE (previous step bin)} + \text{FTE (current step bin)}] / 2.$$

This procedure can easily be implemented in the Excel spreadsheet, as well as coded in R, Python, Microsoft.NET, or in any other coding language.

SOLUTIONS AND RECOMMENDATIONS

In this section, the optimal nursing staffing solutions for some nursing units are presented. The particular hospitals are not named here because some data used in the examples are considered proprietary.

Example 1. Annual and Monthly Optimal Nursing Staffing

The daily variable required nursing staffing for the medical-surgical unit is presented on Figure 3 (panel A), as well as the corresponding ECDF (panel B).

Figure 3. The daily nursing staffing demand for the medical-surgical unit (panel A) and the corresponding ECDF (panel B)

Table 2. FTE bins, ECDF, and the optimal annual nursing staffing level

Staffing FTE Bins	ECDF, $F(S)$	Optimal Staffing, FTE
6.25	0.674	
6.50	0.715	
6.75	0.759	6.625
7.00	0.775	
7.25	0.811	

Using the unit's available financial data, the extra cost of understaffing was assumed \$30/hour per nurse, while the overstaffing per nurse was assumed being the fixed rate \$11/hour. This makes $r=0.73$. The staffing bins and ECDF values are presented in Table 2 (abbreviated to save space). It is seen that $r=0.73$ lies in the interval between ECDF values 0.715 and 0.759. Thus, the annual optimal nursing staffing level is the mean of the corresponding FTE bins, i.e. $(6.5+6.75)/2=6.625$ FTE, as shown in the third column in Table 2. The graphical solution is indicated by the dotted lines on Figure 3 (panel B).

It was previously pointed out that the news vendor's optimal staffing level always corresponds to the minimal possible total cost of under- and overstaffing. Thus, any other heuristically adjusted (higher or lower) staffing level would inevitably

result in a higher total cost of deviations from that level. To illustrate, let us compare two costs of deviation using (i) the optimal staffing value from Table 2 and (ii) the suboptimal average staffing for the same period. The average value is frequently used as a basis in traditional staffing planning.

The total annual cost of deviations of the daily required staffing FTE from the optimal 6.6 FTE (above or below this level) was calculated as the sum of these deviations multiplied by the corresponding hourly costs and by the shift duration 8 hours. The result was \$94,979.

The average annual staffing for data presented on Figure 3 (panel A) was 5.3 FTE. The total annual cost of deviations for this suboptimal level calculated similarly was \$115,012. Thus, the optimal staffing level resulted in about 17% lower costs compared to the average one.

It was mentioned earlier that staffing plans are frequently developed for shorter time periods such as monthly or every 4-6 weeks. To illustrate, the month-to-month optimal staffing levels were calculated using the same computational procedure. Results are presented on Figure 4, along with the annual optimal staffing level (flat solid line) for the comparison.

It is seen a significant month-to-month variation of the optimal FTE vs. the annual one. The bump of the optimal FTE for December reflects

Figure 4. The optimal monthly staffing and the annual optimal staffing level (flat solid line)

Table 3. Monthly optimal and average FTE and the total costs of under- and overstaffing

Month	Optimal FTE	Monthly Average FTE	Total Costs of Under- and Overstaffing		
			For Optimal FTE	For Average FTE	Cost Saving, %
Jan	6.6	5.1	\$ 7,766	\$ 9,697	20%
Feb	8.1	6.5	\$ 5,200	\$ 7,486	31%
Mar	6.6	5.7	\$ 4,988	\$ 7,094	30%
Apr	4.9	4.6	\$ 5,093	\$ 5,893	14%
May	6.9	5.3	\$ 7,870	\$ 9,887	20%
Jun	6.9	6.2	\$ 7,165	\$ 8,167	12%
Jul	6.4	5.0	\$ 5,104	\$ 7,232	29%
Aug	7.1	5.5	\$ 8,924	\$ 10,670	16%
Sep	5.9	4.7	\$ 5,545	\$ 7,477	26%
Oct	4.4	3.4	\$ 6,511	\$ 7,195	10%
Nov	5.4	4.0	\$ 5,087	\$ 6,749	25%
Dec	9.9	8.0	\$ 13,625	\$ 15,351	11%

the corresponding staffing demand peak for this time period (Figure 3, panel A), apparently due to increased patient census related to typical end-of-year seasonal flu epidemics. Thus, the shorter term month-to-month optimal staffing is typically better accounts for seasonal patient census and required staffing variations.

The total costs of under- and overstaffing for the monthly optimal staffing FTE were compared to that for the average staffing FTE in Table 3.

Example 2. The Optimal Staffing for Caregivers' Skills Mix

Previous examples demonstrated the optimal staffing calculation only for one category of caregivers-the nurses. However most nursing units include other staff skills mix, such as nursing assistants (NA), clinical nurse specialists (CNS), nurse practitioners (NP), among others.

Let's consider, as an example, a nursing unit that is staffed with three caregivers' skills mix: nursing assistants (NA), registered nurses (RN) and certified nurse specialists (CNS). In this unit a typical share of workload by the skills mix is 28% for NA, 57% for RN and 15% for CNS. Standard

hours of care per patient day (HPPD) for various levels of patient acuity are presented in Table 4.

Patient data for this unit are presented in Figure 5 (only three weeks' worth of data is included to save space).

The typical cost of under- and overstaffing for RN in this unit was similar to the one used in the previous example. However, the costs for NA and CNS were not readily available. It was assumed that the costs of under- and overstaffing for NA were about the same (\$13-\$15/hour) resulting in the NA cost ratio $r=0.5$. The understaffing costs for CNS was assumed twice the cost of overstaffing

Table 4. Standard hours of care per patient for various levels of patient acuity

Acuity Level	Standard Hours of Care
Level 03	2.8
Level 04	3.4
Level 05	4.0
Level 06	4.6
Level 07	5.5
Level 08	6.6
Admissions	0.5
Discharges	0.5

resulting in $r=0.67$. At the same time, the calculated optimal staffing values for these caregiver categories turned out not too sensitive to the r values. Due to the particular staffing demand and, hence, the shape of ECDF, the NA optimal staffing is not changed with r values in the range $r=0.43-0.56$. CNS optimal staffing is not changed with r values in even wider range $r=0.56-0.75$. Thus, some variations of the poorly known costs were not too critical for the calculated optimal staffing values presented in Table 5, which also includes the total costs of under- and overstaffing for three categories of caregivers both for the optimal FTE and for the suboptimal average FTE. It is seen that the costs of the former is much lower than that for the latter, similar to results demonstrated in Example 1.

In summary, these examples demonstrated that the optimal staffing levels vary with the time periods for which they are calculated (annual,

monthly, or any other). They also demonstrated that the mathematically proved minimal total costs of under- and overstaffing for the optimal staffing values are indeed less than that for any suboptimal staffing levels such as the average. Another goal of these examples was demonstrating the use of ECDF and a simple computational procedure for numerical solving the newsvendor Equation 1. It is recommended that the newsvendor framework is applied to justify a staffing plan whenever it is being developed and budgeted for.

FUTURE RESEARCH DIRECTIONS

The author believes that the following problems merit further research.

Determining the optimal staffing for the future time periods with some projected gradual non-random trend in demand. This trend should be

Figure 5. The number of patients at various levels of acuity, admissions & discharges (ADT) and the daily required staffing FTE for three categories of caregivers NA, RN, and CNS

Certified Nursing Specialist (CNS)	2.4	2.2	\$8,414	\$15,146

incorporated into the current ECDF to account for some shift in the future staffing demand distribution.

A related problem is incorporating sudden demand spikes into the prior staffing demand distribution, e.g., caused by a mass casualty event or an infection outbreak. One approach for doing this could be the use of the Bayesian framework.

One more problem is related to the true costs of occurrences of under- and overstaffing. The called-on float or agency nurses are usually new to the unit, thus they are less productive than the regular staff nurses. Similarly, calling-off nurses by putting them on call or floating into the pool after scheduling up for work usually negatively impacts their morale and productivity. These non-monetary factors could result in underestimating the true costs of under- and overstaffing. It seems that this problem was not adequately addressed in prior research.

Also, the classic newsvendor framework assumes that the costs of under- and overstaffing are constant within the time period. However, these costs could be interrelated with staffing demand. Incorporating this interrelation into the newsvendor framework will further advance its area of application in healthcare settings.

CONCLUSION

The author believes that this chapter convincingly demonstrates the power and versatility of the newsvendor framework to determine the optimal

staffing levels in healthcare settings. In fact, the newsvendor framework is suitable for analysis of various operations management problems. It is also demonstrated the advantages of the ECDF and a simple computational procedure for numerical solving the newsvendor Equation 1. Using this approach, there is no need anymore for developing the best fit theoretical demand distribution or moments of the distribution suggested in earlier research. The author expects that more newsvendor model based operations management applications will emerge in healthcare settings, along with other appropriate data analytics methodologies.

KEY TERMS AND DEFINITIONS

Data Analytics: The discipline and practice of using various quantitative methods to aid in solving business or engineering problems.

Empirical Cumulative Distribution Function (ECDF): A fraction of data-points that are less than or equal to some predetermined values within a set of random numbers.

Newsvendor Framework: An analytical model that provides the optimal inventory or staffing level (in terms of the lowest financial loss due to overage and underage) within a specified single time period.

Optimal Staffing: The staffing level that provides the lowest possible total costs of occurrences of under- and overstaffing compared to any other staffing value within a specified time period.

Overstaffing (Overage): Staffing level that is higher than the actually required.

Patient Classification System: The system that quantifies categories of care in order to objectively estimate the required nursing hours for direct patient care.

Understaffing (Underage): Staffing level that is lower than the actually required.

H

APPENDIX

Let the distribution density function of demand, D , be $f(D)$.

Then the average loss due to overage, i.e. for staffing $S > D$ is:

$$C_o \int_0^S (S - D) f(D) dD,$$

where C_o is the unit cost of overage.

The average loss due to underage, i.e. for staffing $S < D$ (unmet demand) is:

$$C_u \int_S^{D_{max}} (D - S) f(D) dD$$

where C_u is the unit cost of underage.

Total loss function is:

$$L(S) = C_o \int_0^S (S - D) f(D) dD + C_u \int_S^{D_{max}} (D - S) f(D) dD$$

It is minimized with respect to staffing, S , by taking the derivative and making it equal to 0.

$$\frac{dL}{dS} = C_o \int_0^S f(D) dD - C_u \int_S^{D_{max}} f(D) dD = 0$$

Here, the derivative of $L(S)$ with respect to S is taken using the general rule:

$$\text{If } f(p) = \int_{a(p)}^{b(p)} f(x, p) dx, \text{ then}$$

$$\frac{df}{dp} = \int_a^b \frac{\partial f(x, p)}{\partial p} dx + f(b, p) \frac{db}{dp} - f(a, p) \frac{da}{dp}$$

The 2-nd derivative is

$$\frac{d^2L}{dS^2} = C_o f(S) + C_u f(S) > 0 \text{ hence this is minimum.}$$

Thus, $C_o F(S) - C_u (1 - F(S)) = 0$. Consequently, $F(S) = C_u / (C_u + C_o)$.

The same result is produced if the demand distribution is a discrete function rather than the continuous one.

Using Technology to Reduce a Healthcare Disparity

Nilmini Wickramasinghe

Epworth HealthCare, Australia & Deakin University, Australia

INTRODUCTION

Healthcare costs globally continue to rise and the US in particular is struggling to contain healthcare costs (Wickramasinghe et al., 2015, 2012). This has led most OECD countries to focus on healthcare reform coupled with greater investment in IS/IT to facilitate superior healthcare delivery (Wickramasinghe et al., 2015). At the same time, the federal government has affected policy to emphasize meaningful use of such technology in healthcare (Wickramasinghe et al., 2015; “Meaningful Use,” 2012). Hence, it is now prudent to develop appropriate technology solutions that not only comply with this requirement but also facilitate superior healthcare delivery to ensue.

An area that can particularly benefit from the application of technology solutions is that of equal experience and trying to provide equality of care and access to all citizens. A key area within healthcare disparities relates to access of language services in healthcare or more specifically supporting limited English proficient patients (LEP patients). In particular, English language proficiency should not impinge on access to- and quality of- service for healthcare. Improving access to language services in healthcare has been an ongoing issue that continues to be at the forefront of various healthcare agendas ((Au et al., 2009; Barrett et al., 2008; Chen et al., 2007).

BACKGROUND

Recent discussions on healthcare disparities (Gibbons, 2011) all note the significant potential benefit

technology can make in trying to provide an equal experience to all Americans. Sadly, while there are many good points about the US healthcare system, there also exists a considerable racial and ethnic disparity in the delivery of healthcare across the US (Gibbons, 2011). The underlying root causes for these disparities are all amenable to interventions using IS/IT (information systems/information technology). The thesis of this paper is that technology is well suited to assist is that of limited English proficiency (LEP).

More than 23 million Americans today have limited English proficiency, which in turn has a negative impact on their ability to receive and comprehend appropriate healthcare delivery (Youdelman, 2008; Flores et al., 2008). Integral to the delivery of care is communication between doctor and patient; however, language barriers typically lead to problems such as delay or denial of services, issues with medication management, and underutilization of preventative services (Green et al., 2005; Jacobs et al., 2004; Ghandi et al., 2000; Karliner et al., 2004). The literature suggests that the quality of communication between Although Title VI of the Civil Rights Act 1964 has always required that entities receiving federal funds provide language services to those with LEP, the law has not often been enforced in healthcare settings (Jacobs et al., 2006). However, awareness of the need to provide language services in healthcare has increased in recent years (Gibbons, 2011).

Current Problem

In 2001 The Institute of Medicine has published two key reports “To err is Human” and “Cross-

DOI: 10.4018/978-1-5225-2255-3.ch323

ing the Quality Chasm”. Taken together these reports highlight that patient safety should be one of the essential components of high quality healthcare and that patients should not be harmed by the care that is intended to help them. These profound statements have had far reaching impacts to policy reform and efforts to address patient safety and quality of care delivered today. The role of language barriers and their impact on adverse events is thus now also receiving heightened attention. Especially given that research is consistently highlighting that adverse events affect LEP patients disproportionately more and result in serious consequences to the patient.

Approximately 57 Million people or more than 20 percent of the US population speak a language other than English and this figure is growing while approximately 8.6 percent of the population is defined as LEP. Thus at least 8.6 percent of the US population is at risk for adverse events because of barriers associated with language issues. This adds further cost pressures to an already strained healthcare system

To address this problem a technology mediated solution is proffered to provide multi-lingual support at in-take and registration for LEP patients.

Development of the Conceptual Model

Web 2.0 technology and cloud computing which provides and facilitates anytime anywhere access to (Troshani et al., 2011; Svantesson & Clark, 2010; Mell & Grance, 2010; Gilbert, 2010; Amazon, 2011; Armbrust et al., 2010), affords us the possibility to leverage these technology benefits to design and develop an appropriate solution to address the problem – a portal that support multi language real time translation at intake and registration. Figure 1 provides the conceptual model.

From the above conceptual model in Figure 1, it is possible to model the intake process into critical steps. All these 13 steps of care must be addressed in the technology solution and/or suite of solutions if the solution is to provide the necessary assistance for LEP patients. Taken together these steps traverse the healthcare encounter at intake.

Figure 1. Conceptual model

Table 1. Study activity

Actor	Before	During Study
Spanish Speaking Patients	Handed an English language intake form and were asked to fill it out to the best of their ability Often had a family member fill out the form, forms were often difficult to read and were incomplete If no family member was present a Spanish speaking staff administrator was taken off their job and asked to serve as interpreter and fill out the form with patient and increased the cost of serving an LEP patient Completed Forms were often difficult to read and of marginal value to physician provider Cultural behaviors limited the ability to gather information, Older Hispanics, men and women are very reluctant to volunteer information Completed form given to administration desk Completed form was placed in patient intake folder and was available to physician, was not available for other purposes Wait times varied as to availability of	Asked to participate in beta study, if agreeable directed to intake kiosk Offered Spanish language form which was translated into English per study description by medically competent interpreter. In some cases family member filled out form in other cases interpreter filled out form. No problems observed in using kiosk technology Form presentation was clear and understandable by patients Completed form given to administration desk Completed form in electronic format was available for other purposes such as Average duration of form completion action was not a factor
English Speaking Patients	Given paper form Filled out form to best of ability Very often completed forms were not easy to read and of minimal value to physician Completed form was placed in patient intake folder and available to physician, was not available for other purposes	Given option of using electronic intake kiosk with drop down menus and input boxes Faster intake form completion Intake form presentation was clear and understandable by patient Completed form was placed in patient intake folder and available to physician and available for other purposes
Physician	Clarity of intake form depended on writing and communication skill of patient	Electronic format provided easy to read and use intake form
Administration	Begins w patient request for appoint and scheduling of appointment, and request for completion of paper forms prior to actual appoint, on appointment date Patients rarely completed intake forms in advance of appointment If patient did not complete intake form prior to visit a blank form was presented to patient at time of visit If patient was a Spanish speaker a family member or staff would assist with intake completion If no family member available administration staff acted as interpreter. Completed form was used presented to administrator	Administration asked English or Spanish speaking patients if they would be interested in completing an intake form electronically and in native language. Once form was complete either handwritten or electronic it was returned to the administration and placed in the intake folder for clinical visit with physician.

PILOT STUDY

The developed solution was then tested in a small pilot study to assess its reliability and feasibility. A 2 arm control study was designed where both English proficient patients and Spanish proficient patients were randomly selected at a leading Mid-West Multi-specialty healthcare facility. Before the study commenced appropriate ethical clearances were obtained. Table 1 and 2 detail the results from the two week pilot trial as well as the activities that were observed in the study.

Results

The study qualitatively measured the interactions between the patients and the electronic kiosk, the value of a clear and concise intake summary for the physician at the beginning of the medical encounter and the ability of the administrative team in the department to take advantage of the completed electronic intake form for other purposes. There was no attempt to integrate the intake form with electronic medical records. Table 3 summarizes the key findings.

Table 2. Control: English speaking patients

Actor	Event	Outcome
English Speaking Patient	English speaking patients are offered option of traditional paper intake form or completing the form at kiosk with touch screen and drop down menu capabilities.	The Department of Urology serves an aged skewed population. As a general rule the younger the patient the more likely they were to opt for the electronic format. 80% of the patients offered the electronic option chose for to use that. Several patients commented that the electronic version was much faster to use and more consistent with a modern healthcare setting. Other inquired if the electronic form was transferable to other departments. For those patients that chose the electronic version patient satisfaction ranged on the scale of 4 or 5 with 5 being the highest on a 1 to 5 scale.
Spanish Speaking Patient	Spanish speaking patients are offered option of the traditional paper intake form or completing the form at kiosk with touch screen and drop down menu capabilities. The hand written intake form provided by the administration was not translated into Spanish, consequently each Spanish speaking patient opted for the electronic version of the form offered in their native language.	In each case at the electronic kiosk, translator services were incorporated to facilitate the completion of the intake form. Spanish speaking patients were afforded the opportunity to complete the intake in their language while the administration and physician were provided an English language version of the intake form. In each case customer satisfaction was rated a 5 on a 1 to 5 scale. Multiple copies of the completed intake form given to each patient for potential use in other departments.
Physician and Patient	English and Spanish speaking patients were queued to meet with the physician in a business as usual manner.	Physicians who had access to the electronic forms regardless of language spoken by the patient rated the clarity of the information on the electronic form higher than the hand written form. Also, physicians stated that the quantity of the information was greater and offered a more clear picture of the patient medical, family and social status. Physician satisfaction with the electronic form over the handwritten form was ranked higher because the electronic form was easier and faster to read. See appendix xx for sample of handwritten and electronic form.
Administration and Patient	Once the intake forms were completed (English and Spanish), they were handed to the front desk for administration, placed in the patient intake folder and placed in queue for the physician. The form is reviewed by the physician. It is generally not used beyond physician review for other purposes.	After the physician encounter patients were often asked to complete other forms very similar in content to the original intake form. Form redundancy is a major detractor to patient satisfaction and high cost component to administrative efficiency. No other forms have a language assistance component. The impact of this is obvious i.e. when a dietary requirement is needed before a test can be conducted and this requirement is not met on the day of the scheduled procedure because the instructions were not understandable by the non-English speaking patient.

FUTURE RESEARCH DIRECTIONS

Two areas are especially critical when considering future developments of the technology mediated solution. Specifically, one area is to assess the health literacy of the patients no matter if they are LEP or proficient English language speakers. The other key direction involves developing and enlarging the languages offered to include Chinese, polish, Farci and German as these are the foreign languages most in prevalent within the US.

CONCLUSION

The US healthcare provider setting is working to deliver the best possible patient care. It must also meet cost of service objectives and provide physicians the best possible tools to meet patient's expectations. Technology in its many applications will continually be employed and adapted to accomplish these goals. Technology that facilitates communication between the patient and the provider (physician and administration) will have an important role. All healthcare interactions begin

Table 3. Summary of findings

Actor	Event	Outcome
English Speaking Patient	English speaking patients are offered option of traditional paper intake form or completing the form at kiosk with touch screen and drop down menu capabilities.	The Department of Urology serves an aged skewed population. Administration and Patient	Once the intake forms were completed (English and Spanish), they were handed to the front desk for administration, placed in the patient intake folder and placed in queue for the physician. The form is reviewed by the physician. It is generally not used beyond physician review for other purposes.	After the physician encounter patients were often asked to complete other forms very similar in content to the original intake form. Form redundancy is a major detractor to patient satisfaction and high cost component to administrative efficiency. No other forms have a language assistance component. The impact of this is obvious i.e. when a dietary requirements is needed before a test can be conducted and this requirement is not met on the day of the scheduled procedure because the instructions were not understandable by the non-English speaking patient.

and end with communication between the provider and patient. This is a determining factor in successful health outcomes. With greater clarity and availability of patient information there is a greater probability of meeting patient need and managing the cost of delivering service. For example, it is well documented that language barriers (communication barriers) between patients and providers are a leading cause of healthcare disparities. Communication barriers are not limited to the interactions between the patient and physician

but also include the patient's interactions with the physician supporting healthcare infrastructure.

Communication Barriers Impact

Patient - Physician Communication

For example,

1. The inability for physicians to understand a patient's need and thus increase the potential

for medical errors and the associated higher cost of service.

2. Poor communications between the physician and patient extends the healthcare encounter and creates delays in physician access.

Patient – Administration Communication

For example,

1. The ability for the patient to follow with procedural or pharmacy instructions,
2. The ability for patients to provide or understand billing or insurance information, and
3. The ability to follow up with next steps in a treatment protocol which leads to higher cost of service

This study represents a first step to understand the impact of using an electronic intake format for gathering patient information from both English speaking and non-English speaking (LEP) patients. Healthcare disparities plague the US healthcare system and language proficiency is one of these key barriers. Technology does have the potential to reduce this barrier effectively and efficiently so that superior care delivery might ensue. The proffered solution described in the preceding holds the key to potentially addressing this challenge.

KEY TERMS AND DEFINITIONS

Cloud-Based Computing (or Cloud Computing): When computing resources such as software and hardware are delivered as a service over a network.

Healthcare Delivery: The network, structure and stakeholders involved in administering medical care to individuals.

Human Interpreter: Person who performs language translation.

Language Translation: The act of converting the meaning into a different language.

LEP-Limited English Proficiency: Individuals for whom English is not their native language and thus have difficulty communicating and understanding in English.

Meaningful Use: Federal government stipulation for technology solutions in healthcare.

Real-Time Translation: Translation that happens instantaneously at the point of action.

INTRODUCTION

The specific level of health literacy is required for patients to fully understand health information and services to make effective decisions about their health care, including decisions about screening and treatment (Koay, Schofield, & Jefford, 2012). Being able to employ a certain degree of control is recognized as a precondition for the active patient participation and is often discussed concerning health literacy (Nutbeam, 2008). Patients' perceived control over their care is indicated by their perceived ability to perform the self-care activities in the home environment, to interact effectively with health care providers, and to organize care at the right moment (Coulter, 2012). Older patients and patients who are less educated about their health care condition are more likely to have the lower health literacy, visit their health care provider more frequently, and perceive more difficulties in exerting control over their care than the highly educated younger patients (Dahlke, Curtis, Federman, & Wolf, 2014).

This article aims to bridge the gap in the literature on the thorough literature consolidation of health literacy. The extensive literature of health literacy provides a contribution to practitioners and researchers by describing the challenges and implications of health literacy in order to promote the health literacy in global health care.

BACKGROUND

Health literacy is a complicated perspective that depends on the individuals' ability to communi-

cate and the demands posed by society and health care system (Baker, 2006). Lack of specific skills and knowledge associates with health literacy has been shown to negatively affect the people's understanding and use of information provided by health professionals (Rubinelli, Schulz, & Nakamoto, 2009). Effective health care strategies can be used by health care providers to address the serious health care-related problem, including the effective health communication, development of health education materials, professional education, and development of health care community partnerships (Corrarino, 2013). Developing educational materials aimed at individuals with low health literacy, as well as training health care providers on how to effectively communicate with individuals with limited literacy, should be promoted (Ojinnaka et al., 2015). Lupattelli et al. (2014) indicated that clinicians should take time to inquire into their patients' ability to understand health information, perception, and beliefs regarding health literacy.

THEORY AND APPLICATIONS OF HEALTH LITERACY

This section emphasizes the perspectives on health literacy; trends and issues with health literacy; and the challenges and implications of health literacy in global health care.

Perspectives on Health Literacy

Health literacy encompasses several abilities including word recognition, reading comprehension,

DOI: 10.4018/978-1-5225-2255-3.ch324

communication skills, and conceptual knowledge (Macek et al., 2010). The components of literacy include reading, writing, verbal communication, numeracy, and conceptual knowledge (Nielsen-Bohlman, Panzer, & Kindig, 2004). Federman et al. (2009) stated that memory and verbal communication fluency are strongly associated with health literacy. Effective communication among health professions is a necessary component of health care, as no single profession can adequately respond to the complexity of health problems that patients may possess (Barr, 2002).

While health literacy is a complex concept that includes many components, print prose and print document literacy are two essential health literacy skills that help patients understand the written health information (Baker, 2006). Written health information can be found in various areas of health, and includes medical instructions, medication information, disease information, admission forms, informed consent materials, and other examples (Hadden, 2015).

Trends and Issues With Health Literacy

The public health response should include seeking out the new strategies for health systems to promote the public's health literacy, while working with the educational system to better equip the younger generations with the health care-related knowledge and skills necessary to navigate health care (Parker, Wolf, & Kirsch, 2008). In the medical contexts, low health literacy is recognized as a barrier to the health care and treatment adherence, requiring that providers and health care community-based organizations adapt to become more accessible and user-friendly (Liechty, 2011). In the public health contexts, health literacy is recognized as an opportunity for education and empowerment, a capacity-building challenge to enable individuals to exercise more agency in their lives and better utilize the health information and services (Nutbeam, 2000). Public health literacy encompasses skills in evaluating public health information and

the ability to apply it in ways that affect small groups and communities rather than individual's health alone (Freedman et al., 2009).

van der Heide et al. (2015) indicated that in chronic care, patients are expected to fulfill an active role in the care of their condition by fulfilling the care tasks in their home environment. This active patient role is considered as important for maintaining the best possible state of health (Coulter, 2012) and reducing the burden on health care (Cramm & Nieboer, 2012). Not all adults with chronic conditions are able to fulfill this role (Kawi, 2014), either because they are not interested or because they lack the knowledge (Swenson et al., 2004). Patients with higher health literacy are found to take a more active role with respect to their care (Fransen, von Wagner, & Essink-Bot, 2012) and to make less use of health care services than those with lower health literacy (Berkman, Sheridan, Donahue, Halpern, & Crotty, 2011).

An evaluation of government websites from a health literacy perspective has recognized the need for the improvement of readability, user-friendly content, and cultural tailoring (Neuhauser, Rothschild, & Rodriguez, 2007). Cultural competency and health literacy are directly related to health care (Ingram, 2012). Cultural competency is an ongoing process in which a health professional continuously strives to achieve the ability to effectively work within the cultural context of the patient and is a process where there is room for improvement (Campinha-Bacote, 2002). Incorporation of cultural competency into health care education for pharmacy, medical, and nursing students has proven to be effective (Durand, Abel, Silva, & Desilets, 2012) and should be continued in order to increase the awareness of future health professionals.

Challenges and Implications of Health Literacy in Global Health Care

Sentell et al. (2014) stated that primary care providers and facilities should consider health literacy at both community and individual levels. Providing

advice and guidance to individuals regarding both their mental well-being and physical well-being improves the service users' self-esteem and increases their ability to manage their own health (Lennox, Bain, & Rey-Conde, 2007). Hemingway et al. (2015) indicated that people with a learning disability or serious mental illness significantly experience the complex health inequalities that cannot be only understood from the perspective of their condition. Health and social care staff providing services for people with a learning disability increasingly need the education and training in the physical health interventions (Manthorpe & Martineau, 2010).

Adults with inadequate health literacy skills have less ability to identify their medications (Kripalani et al., 2006). Regarding medication adherence, clinic efforts to improve the patient's access to the affordable medications include helping patients with filling out prescription assistance program paperwork, prescribing generic medications, providing samples, and encouraging effective patient education (Alton, March, Mallery, & Fiandt, 2015). Kairuz et al. (2015) stated that low health literacy has the important consequences for health status, medication adherence, and utilization of health services.

Low health literacy is expected to be associated with medication non-adherence (Ostini & Kairuz, 2014). Lower levels of health literacy are associated with a wide range of health-related outcomes, including higher mortality, worse general health, poor health care access, more hospitalizations, and greater use of emergency care, higher health care costs (Eichler, Wieser, & Brugger, 2009), greater difficulty participating in the shared decision making, and a worse medication adherence, and self-management in general (Easton, Entwistle, & Williams, 2010).

Poor health literacy is associated with poor physical health care and mental health care (Wolf, Gazmararian, & Baker, 2005), less use of flu vaccination (Scott, Gazmararian, Williams, & Baker, 2002), and increased mortality (Sudore et al., 2006). Public mental health efforts are

needed to raise the caregiver's mental health literacy (Mendenhall & Frauenholtz, 2015). Mental health literacy is an important factor in the early detection and prompt treatment for the mental, emotional, and behavioral disorders among young people (Olsson & Kennedy, 2010). Poor mental health literacy is associated with the lower rates of help-seeking and service use, as well as societal stigma and discriminatory behavior (Evans-Lacko, Brohan, Mojtabai, & Thornicroft, 2012).

Dunn et al. (2009) indicated that tracking mental health literacy within populations is important as it has been shown to be related to the individual help-seeking as well as the provision of support for those with a mental disorder. Mental health disorders have detrimental effects on well-being, functioning, and development in adolescence (O'Connell, Boat, & Warner, 2009). A recent review of help-seeking for mental disorders considers lack of knowledge regarding mental health as the major obstacle preventing young people from seeking the health-related assistance (Gulliver, Griffiths, & Christensen, 2010).

Regarding mental health literacy, both public stigma and self-stigma have a broad range of negative ramifications for those with mental illness, remarkably social exclusion, and reduced treatment-seeking (Patel et al., 2010). Negative attitudes toward mental illness are commonly endorsed by adolescents (Reavley & Jorm, 2011). High levels of these stigmatizing attitudes among adolescents are associated with the reduced intentions to seek the professional assistance and a lower likelihood of viewing such health-related support as helpful (Yap, Reavley, & Jorm, 2013), and effectively influence the first aid actions toward the distressed peers (Yap & Jorm, 2011).

Numerous studies have emphasized the importance of an adequate level of health literacy to the disease management process (Cho, Lee, Arozullah, & Crittenden, 2008). The inadequate health literacy is a potentially modifiable determinant of poor health outcomes in people with chronic disease (DeWalt, Berkman, Sheridan, Lohr, & Pignone, 2004). Poor reading skills are

associated with an increased use of emergency care, a decreased use of preventive services, and poor health maintenance (Easton et al., 2010). The connection between health literacy and health behavior is likely to be intermediated by knowledge and self-efficacy (Osborn, Paasche-Orlow, Bailey, & Wolf, 2011).

Among adults, low health literacy has been associated with poorer health status and poorer health outcomes, such as the lower medical adherence, lower awareness of medical condition, longer hospital stays, and greater use of the emergency department (Nielsen-Bohlman et al., 2004). Children of parents with lower literacy skills are more likely to have the worse health outcomes (Sanders, Shaw, Guez, Baur, & Rudd, 2009). Low health literacy among parents has been found to be associated with the poor child's health outcomes (DeWalt, Dilling, Rosenthal, & Pignone, 2007).

FUTURE RESEARCH DIRECTIONS

The classification of the extensive literature in the domains of health literacy will provide the potential opportunities for future research. Health literacy is the degree to which individuals have the capacity to obtain, process, and understand the basic health information needed to make appropriate health decisions. Training in health literacy, the use of simple language, and the effective communication is essential for people working in health information and services toward improving the quality of care and reducing the medical error in the health care industry.

The effective communities of practice (CoPs) facilitate the social interactions and encourage the members' willingness to share knowledge and ideas in the workplace (Kasemsap, 2016a). Social media tools are open to anyone, whereas reaching the traditional media often requires a lot of money and a good network of media industry contacts (Kasemsap, 2016b). Total quality management (TQM) practices in quality performance has the

potential to improve organizational performance (Kasemsap, 2015). Promoting health literacy in the health care industry through health care-related training program, CoPs, social media, and TQM activities will be the valuable topic for future research direction.

CONCLUSION

This article highlighted the perspectives on health literacy; trends and issues with health literacy; and the challenges and implications of health literacy in global health care. Health literacy is very important in the health care industry. Health literacy concerns the knowledge and skills of patient to meet the complex demands of health care perspectives in the health care industry. Providing effective patient information means acknowledging, understanding, and overcoming barriers to health literacy that physicians, health professionals, and patients might experience. Health literacy affects health behavior and the use of health services, thus affecting health outcomes and health costs in the health care organizations. The benefits of health literacy improvement include improved communication, greater adherence to treatment, greater ability to engage in self-care, improved health status, greater health care efficiency, and cost savings to the health care systems.

KEY TERMS AND DEFINITIONS

Communication: The two-way process of reaching mutual understanding, in which participant not only exchange information, news, ideas, and feelings, but also create and share meaning.

Health Care: The act of taking the preventative or necessary medical procedures to improve a person's well-being.

Information: The data that is organized for a specific purpose and presented within a context that gives it meaning and relevance.

Knowledge: The understanding of a circumstance gained through experience.

Literacy: The ability to read and write.

Patient: A person who is receiving medical care, or who is cared for by a physician or health professional, when necessary.

Skill: The ability acquired through the deliberate, systematic, and sustained effort to smoothly and adaptively execute the complex activities.

Understanding: The knowledge about a situation or about how something works.

Cyber Behaviors in Seeking Health Information

INTRODUCTION

Warner and Procaccino (2004) defined health information seeking (HIS) as “the process of seeking information needed for personal decision-making related to health and medical issues.” HIS constitutes an important part of people’s information seeking behavior. In analyzing a Pew Research Center survey, Kennedy and Funk (2015) reported that about 66% online adults show interests on health and medicine topics, while 37% of online adults claim that “health and medicine” is one of the topics they deem as most interesting. Kennedy and Funk (2015) also noted that research on measuring public understanding about science and technology usually relates science and technology to the health and medical domain.

Consider the following scenario in your ordinary daily life (Yuan & White, 2012). Shown in Figure 1.

In this scenario, people need to 1. Deal with a need of seeking information on headache and brain tumor, which could be a complex task for people with limited medical knowledge. 2. Overcome potential stress caused by knowing about others’ stressful events (e.g. deaths). 3. Share information with others who have similar concerns. Each of these three items is explained in further detail below.

1. In completing complex tasks, people need guidance to go through the required steps towards completing the tasks, instead of a simple ranked list (Joachims et al., 1997). The information foraging theory developed by Pirolli and Card (1999) provided a theoretical foundation for this situation. This theory indicated that information seekers rely on cues left by previous visitors to identify *patches* of information, and then use them to

Figure 1.

Scenario: You have been bothered by a headache for a while. Your primary doctor suggested that you take a series of tests, but the results revealed nothing serious. One of your friends died of a brain tumor several years ago. You are worried about your own situation and would like to explore the issue in more detail. Specifically, you want to learn more about the types of headache, the corresponding symptoms, the causes, and the remedies for each type. You want to find websites with useful information and share your findings with others by posting as many Web links as you feel are necessary to adequately cover the topic on a social networking site such as Facebook.

Task: Please find as many Web links as you feel are necessary to adequately cover the topic and you believe can be useful to people in a similar situation. Copy and paste the Web links to the answer sheet. In the answer sheet, please answer each question. Also, create a sequence of Web links, comprising all links you selected or some sub-set, arranged so as to be useful to others.

DOI: 10.4018/978-1-5225-2255-3.ch325

solve their information problems. Building on the previous findings and the information foraging theory, in a HIS context, Yuan and White (2012) studied the impact of domain knowledge on information seeking behavior and found that expert-generated sequences of web pages are more useful than those of novice users.

2. According to Folkman (1984), stress is “a relationship between the person and the environment that is appraised by the person as taxing or exceeding his or her resources and as endangering his or her well-being.” Studying information behavior models, Wilson (1997) reported that “stress arises in many situations that are considerably less than life-threatening but may endanger one’s “well-being” or, perhaps, self-image, in other ways.” Wilson also argued that stress arose in HIS because “the emotional impact of life-threatening diseases or operations is very obvious.” Current research indicates that people’s awareness and stress level are increased when they are provided information about stressful events associated with other people’s lives (Hampton et al., 2015; Smith and Rose, 2011).
3. How to design a system that can help users learn, understand and use during the information seeking process has been challenging. Twidale et al. (1997) suggested that “a truly user-centred system must acknowledge and support collaborative interactions between all users.” They proved that collaboration can actually help improve users’ learning and understanding of the systems. A well designed system should be able to help people get needed information and share it with those who have the same information need. People who are seeking the same or related information may probably also benefit from collaboration by division of labor.

Yuan & Dumas (2012) reviewed the recent literature in the field of information science and

human computer interaction, and proposed Collaborative Information Seeking (CIS) as one of the promising directions. CIS was defined as “a research area about studying how people work in collaborative groups for information seeking, gathering and sharing, and also about how to build systems for supporting such activities.” (Yuan & Dumas, 2012). Collaboration may be an advantageous process for individuals faced with a task, as Grey (1989) identifies it: “a process through which parties who see different aspects of a problem can constructively explore their differences and search for solutions that go beyond their own limited vision of what is possible”. Karunakaran et al. (2013) proposed that collaborative information behavior involved three phases, including problem formulation, collaborative information seeking, and information use.

The field of CIS has been covered in main international conferences such as the ACM International Conference on Information and Knowledge Management (CIKM), the annual European Conference on Information Retrieval (ECIR), the ACM Special Interest Group on Information Retrieval (SIGIR), the ACM Conference on Computer-Supported Cooperative Work and Social Computing (CSCW), the ACM SIGCHI conference on Human Factors in Computing Systems (SIGCHI), the ACM SIGIR Conference on Human Information Interaction and Retrieval (CHIIR), and the Annual Meeting of the Association for Information Science and Technology (ASIST). Relevant journals are Journal of Information Processing and Management (IP&M) and the Journal of the Association for Information Science and Technology (JASIST). A special issue of IEEE Computer in 2014 was also dedicated to CIS. Finally, a related book has been released (Hansen et al., 2015).

This paper discusses HIS behavior in general, and then followed with collaborative HIS behavior in terms of the current status, the representative researchers and their work, challenges and future directions. All aspects of collaborative HIS constitute a wide field and thus, this paper focuses

on the HIS social dimension and explores how collaborative HIS could contribute to promoting people's positive health behavior. Afterwards, collaborative information seeking systems are introduced, and future directions and conclusion are discussed.

BACKGROUND

Research has shown that HIS behavior varies depending on user's information needs and situations. People tend to use different strategies and resources to look for various types of information to satisfy their information needs. Johnson and Meischke (1991) reported that when searching about cancer, people tried to find factual information on how to prevent, detect and treat cancer. This study indicated that people may also look for information to help them emotionally cope with their health problems. In a research on HIS behavior of medical experts versus novice users, Yuan & White (2012) found that medical experts utilized different seeking strategies and selected different information resources than those of novice users; and medical experts selected more relevant and useful URLs than novice users. Warner and Procaccino (2004) indicated that people's HIS process may involve multiple channels, including formal ones (e.g. physicians and other health professionals, health organizations, librarians, and media), informal channels (e.g. friends and relatives), and hybrid channels (e.g. formal and informal Internet health resources, and interactive sites including online chat groups, facebook, and twitter).

Researchers have studied factors affecting people's HIS behavior. These factors include technology use and social media (Smith and Rose, 2011), age (Connell and Crawford, 1988; Watkins et al., 2014), gender (Connell and Crawford, 1988; Warner & Procaccino, 2004), motivation and emotion (Kassulke et al., 1993; Wilson, 1997).

Connell and Crawford (1988) proved that women believed they collected more health information than men from different sources. They

related this finding to the mother nature of women: they are care-givers and "lay health care providers". This finding was confirmed by research on a national cancer information service (BACUP) by Slevin et al. (1988), in which women contributed 80% use of the service. Connell and Crawford (1988) also found that age plays a critical role in the amount of health information urban residents received from a variety of sources. Specifically, older men received much fewer information than younger men; and older women received slightly fewer information than younger women. In terms of an exploratory study of online HIS behavior in Hong Kong, Yan (2010) found that digital divide is obvious based on age and education. To address the information need of older adults and to balance the gap between their knowledge on health need and recent technologies, it could be helpful to design appropriate mobile apps for older adults. Watkins et al. (2014) found that it is important to help older adults change their health behavior in a positive way, such as increasing their daily fruit and vegetable intake by supporting their search for useful information with touch devices like Apple iPads. They generated 14 usability heuristics for older adults and iPad apps and further conducted a heuristic evaluation study to identify the existing usability issues of the current iPad apps.

It has been debated whether the use of technologies negatively affected or positively promoted people's health behavior in general. Hampton et al. (2015) examined whether the use of social media, mobile phones and Internet can potentially lead to higher levels of stress. Results indicated that (1) use of Internet and social media does not lead to higher levels of stress. In fact, women who use social media frequently perceived lower levels of stress; (2) in a situation that people are aware of other people suffering stressful events, their own stress increases. This situation is called "cost of caring." In particular, in comparison to men, women are more sensitive to the stressful events of their closest friends and family (Hampton et al., 2015). Social interaction is an important factor to be considered in this "cost of caring" situation.

Thus, we must take into account the social dimension in HIS process. Radecki and Jaccard (1995) demonstrated that user perception of a friend's knowledge has an impact on their perception of their own knowledge. The importance of social dimension in HIS behavior has also been addressed by other researchers in the field. Kassulke et al. (1993) noted that emotional barriers, defined as "a construct consisting of questions relating to an inability to make decisions about health and to take advantage of existing health services", could dramatically limit people's access to health services. The information seeking behavior model of Wilson (1997) pointed out the relation between emotion, motivation and effectiveness of information seeking processes, and the critical role of social interaction in people's HIS behavior.

There exist evidence to support the claim that the social dimension of HIS behavior demands more research on collaborative HIS behavior. For example, the cost of caring situation (Smith and Rose, 2011), in which the link between the level of stress to HIS behavior was considered by taking into account the social dimension in HIS. Yuan & White (2012) compared the usefulness and effectiveness of search trails (the sequence of webpages in the order of usefulness) generated by medical experts and novice users, and found that the trails of experts were more effective and useful than those of novice users. In their study, the task scenarios (mentioned in the Introduction) are about finding information for someone they know who was diagnosed with serious illness. The findings indicated that under such a "cost of caring" situation, people tended to go to trusted websites (e.g., www.nih.gov) to search for information, and they rely on opinions of experts. Results also indicated that domain experts used different strategies in selecting resources and structuring search trails than those of novice users. In a study relevant to information visualization and presentation techniques, Yuan et al. (2015) investigated how different information presentation styles affected consumers' preference and decision-making in purchasing product online. They found that con-

sumers prefer some specific presentation styles in their purchase decision making in an opinion summarization task environment. These research efforts created opportunities to integrate or apply research in general HIS to the field of CIS.

In sum, research has been paying attention to the importance of incorporating collaboration in information seeking processes and designing information retrieval systems to satisfy people's health information needs. Next, CIS in health in general will be discussed, followed by system and user interface design of CIS systems.

COLLABORATIVE INFORMATION SEEKING IN HEALTH

Traditionally, information seeking is a solo activity, but with technology evolution, the ways people seek information changed. In many cases, people need to share information and/or learn from others. As Twidale and Nichols (1996) noted, "The use of library resources is often stereotyped as a solitary activity, with hardly any mention in the substantial library science and information retrieval literature of the social aspects of information systems." They believed users would more effectively learn and use information retrieval systems if such systems can support collaboration. Twidale et al. (1997) proposed that "a truly user-centred system must acknowledge and support collaborative interactions between users." Morris (2007) found that introducing support for collaborative search could improve the features of exploratory search, i.e., coverage, confidence, exposure, and productivity. These studies demonstrate the importance of considering collaboration in the information seeking process and system design/development.

Research revealed the importance of CIS in people's daily work. Based on a survey of academic researchers' collaborative information seeking behavior, Spence et al. (2005) found that researchers employed various tools (e.g. e-mail, phone, and video-conferencing) to collaborate during information seeking processes. In this

study, researchers felt that they were motivated to collaborate in seeking information mainly because of their lack of expertise. More importantly, results indicated that CIS is generally successful and more useful than seeking information individually. In the health and medical domain, research on CIS process and its affecting factors have become increasingly important. In a study of patent office workers, Hansen and Järvelin (2005) reported that researchers should reframe the hypothesis that information retrieval performance is just individual-based. Within the context of hospital care, Gorman et al. (2000) studied how members of an intensive care team collaborated together to seek and share information. They discussed the importance of putting different information sources together to answer team members' questions. Based on examining the radiological request form in a study of intra-departmental coordination at a hospital, Symon et al. (1996) reported that the form used to schedule radiology examinations can only provide incomplete information. Thus a number of workarounds by the staff were needed in order to identify the needed information. This research concentrated on information needs and information records, as well as helping the medical staff find needed information. Reddy and Dourish (2002) investigated how work rhythms played the role in team members' CIS activities in an intensive care unit. Understanding work rhythms can enable team members know when information is needed. Subsequently, team members could collaborate with each other for needed information at appropriate timing. As Grudin (1994) pointed out, "Many expensive failures in developing and marketing software that is designed to support groups are not due to technical problems. They result from not understanding the unique demands this class of software imposes on developers and users." The above mentioned research made it possible to develop effective CIS systems by understanding such demands.

On the technical side, effort has been made to develop collaborative information systems (CIS) to better support interaction and collaboration dur-

ing people's information seeking process. Some representative systems are introduced below. These systems were designed with different focus and approaches, including support for collaboration (1) at the user interface level (Twidale et al., 1995); (2) at the system-mediated level (Pickens et al., 2008); (3) on awareness (Morris & Horvitz, 2007; Shah, 2010); and (4) on communication (Krishnappa, 2005).

In terms of system design for collaboration, Twidale and Nichols (1996) claimed that a visualization of the search process that can be changed and communicated by the real users must be developed. The "Ariadne" system was developed by Twidale et al. (1995) for supporting the collaborative learning of database browsing techniques. In this system, a visualization of the search process was designed to "facilitate complex browsing processes in collaboration." Such a visualization is composed of thumbnails of screens presented as play cards, representing *command-output* pairs. Each play card can be expanded to display the contents. Pickens et al. (2008) proposed a CIS system designed using algorithmic mediation for synchronous collaborative search and communication activities. In this system, people can search together to solve a common information problem. MUSE, a collaborative information seeking and retrieval prototype (Krishnappa, 2005) was designed with the focus on communication. After evaluating MUSE, Krishnappa suggested that the collaborative features (e.g. the chat function) improved collaboration between teams in the information seeking and retrieval process. In particular, they found that using the chat function enabled users to understand both the search process and the findings.

As one of the important features in the design of CIS systems, awareness has been considered from various perspectives. Schmidt (2002) suggested that awareness should be considered "not as a separate entity, but as someone's being aware of some particular occurrence." Morris and Horvitz (2007) developed a system called SearchTogether that incorporates awareness using various methods,

including per-user query histories (it shows each team member's screen name, photo, and queries in the "QueryAwareness" region); and display of page-specific metadata. Query awareness was identified as an important feature in collaborative searching by allowing team members to share their query terms and to learn various query formulation techniques from each other. Coagmento (Shah, 2010) is a system exploring awareness in various interface designs. The major difference between SearchTogether and Coagmento is that the former supports searching and sharing, but the latter also supports organizing and synthesizing information. Regarding awareness, besides query and results awareness, the latter also considered contextual and workspace awareness.

Challenges exist in the design and evaluation of CIS systems, and in health information system research in a broader context. After examining the publication of health information systems research (HISR) in 17 IS journals since 1985, Chiasson and Davidson (2004) claimed that "healthcare poses significant challenges to IS theory, but, by taking on these challenges, HISR researchers can contribute to this multidisciplinary field as well as expand the body of IS knowledge." Furthermore, they suggested that the health care industry "poses important social challenges and intriguing research possibilities for researchers interested in the development and use of information systems and technologies." Baeza-Yates & Pino (1997, 2006) took the initiative to formally evaluate Collaborative Information Retrieval proposing metrics to do so. The evaluation of Collaborative Information Retrieval/Seeking is still a challenging endeavor. Soulier et al. (2015) mention this occurs because there is a variety of confounding factors such as the multi-user context, the exploratory aspect of the search through multi-session search activities, the multiplicity of relevance factors, the individual vs. collective value of relevance, and the search interfaces supporting the collaborative interactions. A framework to evaluate CIS has been proposed by Antunes et al. (2012).

FUTURE RESEARCH DIRECTIONS

Collaborative Health Information Seeking is an area facing technical challenges common to CIS in general, as mentioned above, like the evaluation one. However, the area will greatly benefit from advances in social networks, since it presents many characteristics associated to them. It is yet to be investigated how people in the scenario mentioned in the Introduction can get a good result belonging to communities with varying degrees of knowledge on health-related subjects, using advanced systems either controlled by the community members or system-driven, accessed from any place at any time, using crowdsourcing, distributed search strategies and ontologies.

Generally speaking, future directions in CIS include, but not limited to the following aspects.

- It is important to comprehensively understand in which situations people need to collaboratively seek for health information, including topics of interest, level of detail, and stages of information seeking. Based on such understanding, how people interact and collaborate to satisfy their health information needs should be investigated, e.g., the relationship between tasks (including task complexity and task types), supporting techniques, and stages of information processes. Furthermore, CIS systems should be designed to respond to the findings of these investigations, in order to better serve people's HIS.
- With the development and use of mobile devices and applications, mobile health behavior is becoming an important research area. Kassab and Yuan (2012) found that searching for information is the main motivation for people to access the internet resources using mobile devices. Taking into account the importance of HIS (Kennedy and Funk, 2015) and the fact that 44% active users accessing Facebook using mobile

devices (Dan, 2011), research on people's collaborative health information seeking using mobile devices would be an important area to grow. Meanwhile, the progress of speech recognition technology in a mobile environment creates opportunities to incorporate a spoken language interface to collaborative information seeking systems for the purpose of improving interaction and collaboration during people's HIS process. Previous findings (Begany, Sa, & Yuan, 2015; Yuan & Sa, 2016) on spoken language interface may be able to apply to the CIS interface.

- Research on how to apply methodologies and findings of health ICT (information and communication technologies) to collaborative information seeking would be a promising direction. Begany, Mirzaei and Yuan (2014) started a mobile diary study project to investigate health information behaviors of ICT users. They aim at understanding the use of ICTs (e.g. computers, laptops, tablets, smartphones, cellphones, and health wearables) for HIS and provide practical implications for the design of future health information systems, applications and devices (including health wearables).
- As Shah (2015) pointed out, it is meaningful to look at the different visualization methods of CIS interfaces, and find out which kind is useful for CIS users. Future research should also address the need of evaluation of CIS systems and setting up standards for such evaluation.

CONCLUSION

Seeking health information is an important component of Cyber behavior. CIS has become part of people's daily lives with the advancement of technologies, devices and tools provided in the

digital society. CIS became increasingly important because of the nature of the task, and the phenomenal change on the way people interact and share information through social networks. The development of technologies and social networks pose challenges and opportunities to researchers and practitioners interested in CIS to deeply explore relevant collaboration activities, and design and implement CIS systems to support such activities. More studies involving a large and diverse group of users should be conducted to find out real information needs in the situation requesting collaboration and sharing. System design and evaluation should take into account the complexity of tasks, the information needs and situations.

KEY TERMS AND DEFINITIONS

Collaborative Health Information Seeking: People seek for health information collaboratively.

Collaborative Information Seeking System: An information system supporting collaboration and sharing among users during their information seeking processes.

Cost of Caring: People get stressful when they know of stressful events occurred in other people's lives.

Health Information Seeking (HIS) Behavior: Human information behavior related to seeking for health information to satisfy human information needs.

Health information Systems Research (HISR): The multidisciplinary research relevant to the design, construction and use of information systems and technologies in a healthcare setting.

H

Information Systems and Technology Projects in Healthcare Organisations

Jorge Gomes

ISEG, Universidade de Lisboa, Portugal

Mário José Batista Romão

ISEG, Universidade de Lisboa, Portugal

INTRODUCTION

The challenges facing healthcare organizations require more comprehensive and integrated solutions and efficient resource management as a means of eliminating inefficiencies and of achieving promised benefits. In academic literature, information systems and technology (IS/IT) have been recognized as being an organizational capability that can lead to competitive advantage and better performance (Bharadwaj 2000; Kohli & Devaraj 2003). Organizations recognize project management as being a fundamental tool for the development of initiatives which lead to the implementation of the organizational strategies (Crawford, 2005; Hodgson, 2002). One way that the effectiveness of IS/IT project management capability has been assessed is through the use of maturity models, with the underlying assumption that higher levels of project management maturity imply a higher effectiveness of project management capability (Kwak & Ibbs 2002; Sonnekus & Labuschagne, 2004).

Our research focuses on the combination of the project management and maturity models approaches as a means of strengthening the final results of IS/IT projects in the healthcare sector. It is the authors' belief that this combination of approaches enhances not only the success of projects, but also the realization of the expected

benefits. It is also important to emphasize that, by taking advantage of the specific features of each of these approaches, their structure will certainly increase the effectiveness of IS/IT projects in the health sector, by enhancing both the confidence of sponsors and investors, and also the achievement of the promise benefits.

The maturity models approach provides a framework which helps organizations increase their capability to deliver projects on schedule, within budget, and according to the desired technical performance (Levin & Skulmoski, 2000). Projects are temporary achievements that are used to solve various types of tasks of variable size, and are applicable in a very broad range of business sectors (Maylor, 2001). Project management coordinates skills and organizational knowledge and follows the progress of a set of pre-established activities in order to achieve objectives (Kronbichel, 2009). Many organizations fail to review whether the planned benefits of IS/IT projects have been achieved, or not, as they do not possess sufficient resources to undertake such a benefit review, and, moreover, they are constantly under pressure to deliver other projects (Bennington & Baccarini, 2004). Benefits management identifies goals and benefits by combining organizational changes and investments in IS/IT, and also by showing the way to achieve them (Gomes, Romão & Caldeira, 2013; Ward & Daniel, 2006).

BACKGROUND

Literature Review

Whilst there is general agreement that IS/IT does indeed contribute to adding business value, there is uncertainty as to how these contributions were really obtained (Melville, Kraemer & Gurbaxani, 2004; Devaraj & Kholi, 2003). Although many studies have focused on the consequences of IS/IT investments, fewer studies have examined factors which impact the capability of IS/IT (Devaraj & Kholi, 2003).

Project Management Institute (PMI) (2012) define project as a limited effort in time, which is undertaken to create a product, service or a result. The essence of project management is to support the implementation of these temporal initiatives under the framework of an organization's competitive strategy, in order to successfully deliver a particular outcome (Milosevic, 2003; Senhar & Dvir, 2007). Project management is thus a set of management activities which is required to ensure that projects which are defined, planned and monitored, go on to achieve agreed objectives and benefits (Deveraj & Kohli, 2003). Kerzner (2009) highlights the importance of project management in the planning and control of organizations' resources, helping to achieve, not only short-term goals, but also broader, temporal objectives.

It appears that determining whether a project is a success, or not, is far more complex. Success is perceived differently by the different stakeholders involved in the projects (Freeman & Beale, 1992). The differences in success criteria definition should reflect the different interests and points of view, which leads us to conclude that project success is a multidimensional criterion (Freeman & Beale, 1992; Pinto & Mantel, 1990). Success criteria known as the 'iron triangle' have been criticized for their exclusive focus on the project management process, to the detriment of including the vision and goals of the different stakeholders (Baccarini, 1999; Bannerman, 2008).

This classic approach remains the most widely used measure of project success and its main value is in offering a simple, direct measure of performance of the project, but it neglects whether the deliverables fulfilled the objectives of the project (Bannerman, 2008).

The improvement in the success of projects results from increased maturity and organizational competence (Sergeant et al., 2010). Higher levels of maturity will, in most cases, lead to improved project outcomes (Nieto-Rodrigues & Evrard, 2004). Projects which have multiple stakeholders, with different perspectives about the purpose of the project, usually have different expectations as to what the project should achieve (Lim & Mohamed, 1999). Since the success of a project depends on the perceptions of a large number of stakeholders, "*absolute success*" probably never exists in project management, but only "*perceived success*" (Baker, Murphy & Fisher, 1988). In the academic literature, we found examples of projects that have successfully completed the criteria of the "iron triangle", but resulted in disappointing business experiences (Shenhar et al., 2005). On the other hand, initiatives that did not meet the constraints of cost and time later proved to be successful (Pinto & Slevin, 1988). The understanding of the concept of project success has evolved over recent decades, and a gradual understanding is now emerging that project success requires a broader and more comprehensive definition.

Aaltonen et al. (2008), state that the key issue in project management is managing the relationship between the project and its stakeholders. There is little evidence to suggest that process capability improvement result in improved project success, although a few studies are promising in this respect (Mullaly, 2006; Lee & Anderson, 2006).

Maturity models have become an important evaluation tool for measuring the internal and external capabilities of organizations. Maturity models describe the development of an entity over time (Klimko, 2001) and they represent a structured collection of elements which highlight

the characteristics of effective processes at different stages of development (Pullen, 2007). The maturity models approach provides a theoretical framework for improving the business outcome of an organization, for assessing their strengths and weaknesses, and also for allowing comparisons with industry best practices and also by benchmarking with similar organizations (Ibbs & Kwak, 2000). Several studies focus on the recognition of the benefits of investment in project management skills in organizations and others have discussed the issue of the correlation between level of maturity and the performance of projects (Ibbs & Kwak, 2000; Ibbs & Reginato, 2002; Mullaly, 2006). In an IS/IT discipline, maturity is considered to be a measure for evaluating an organization's capabilities (Rosemann & Bruin, 2005). Measuring the maturity of organizations is a difficult and somewhat subjective task, as such an audit process focuses mainly on individuals' tasks (Andersen & Jessen, 2003). Working with different types of projects within an organization requires standard models, in order to deliver successful future projects repeatedly and as a means of improving the quality of future projects and of gaining knowledge and learning from past successes and mistakes. The assessment of maturity typically involves variations along five developmental stages (Jugdev & Thomas, 2002).

These assessment procedures help organizations to understand where they have been, where they are, and what processes they need to implement, in order to continue their implementation of management methodologies. The underlying assumption in the maturity models is that there is a relationship between higher levels of maturity and improved organizational performance (Ibbs & Kwak, 2000; Lee & Anderson, 2006) and that this enhances project success.

The Healthcare Sector

Today, healthcare organizations are increasing focusing on the need for investment in IS/IT, with the goal of achieving the minimum level of benefits that these projects can attain. The study

of the success or failure of these initiatives has become vitally important for the performance of these organizations (Rahimi & Vimarlund, 2007). Since the 1990's, the health sector has sought to improve its effectiveness and efficiency by adopting IS/IT to increase quality levels (Raghupathi & Tan, 1999). The use of IS/IT in health sector is recognized as being a major factor which has improved clinical practices and supportive care (McDonald et al., 1998). The use of these systems provides an important support for specialized services and it increases the efficiency, quality and safety of patient care, and also reduces medical errors (Low & Chen, 2012). It is not always investments in IS/IT that result in efficiency and effectiveness gains, and thus it becomes essential to evaluate the factors that limit performance, and to identify opportunities for enhancing their use.

IS/IT has the potential to dramatically change the way individuals or society see the healthcare sector, and also to provide tremendous opportunities for supporting professionals, and for improving effectiveness and efficiency in the health sector (Ammenwerth et al., 2006).

There is a growing consensus that organizational factors are far more critical for the successful implementation of IS/IT, than technical considerations (Markus et al., 2000). Achieving successful change is much easier if all stakeholders are committed, and the earlier this commitment is achieved, the smoother is the path to a successful outcome (Bradley, 2006).

We live in times where healthcare providers generate significant amounts of personal data about patients and the major obstacle to the management of this increasing volume of information is the difficulty, or inability, of sharing information across systems and between organizations (Grimson et al., 2000). Medical information needed for clinical decision making has increased dramatically, however the accessibility of health data is still poor, resulting in inappropriate decisions and sometimes in medical errors (Tierney, 2001).

The use of informatics tools has been developed to increase the accessibility and management of

medical information (Bleich, Beckley & Horowitz, 1985), with the aim of supporting medical decision, of increasing the coordination between different health care providers, and of promoting the use of guidelines, thereby improving the global quality of care (Pringle, 1988; Shiffmann et al., 1999). However, in addition to providing new capabilities, new technologies also impact the technical, social, organizational, economic, cultural, and political dimensions of work in new and different ways (Anderson & Aydin, 1994).

Observations of new technology implementations have shown that a change in technology alters roles, strategies, and paths to failure (Sarter, Woods & Billings, 1997). In recognizing this, the Institute of Medicine of the USA recommends examining new technologies for avoiding threats to safety and redesigning them to prevent undesirable accidents (Kohn, Corrigan & Donaldson, 2000).

There is a widespread feeling that a significant proportion of initiatives in IS/IT healthcare have failed (Heeks & Davies, 1999). Studies have identified high failure rates in IS/IT projects in various sectors, including that of healthcare, particularly in hospitals (Kaplan & Harris-Salamone, 2009; Wears & Berg, 2005). The results of the implementation of IS/IT projects in healthcare have revealed a waste of financial resources in acquiring large sized systems, which are totally ineffective (Heeks, 2006). In various aspects, these implementations are different from other projects, in other industries. The key main differences were related to the environment, the diversity of systems and the devices that need to work, together with the challenge of integration and interoperability which is required to meet the expectations of different stakeholder groups regarding that which constitutes project success (Abouzahra, 2011). Healthcare projects are a complex undertaking, which depend largely on the quality of existing information (Bose, 2003).

Proper training is a major determinant for success in the adoption of IS/IT by health professionals, and it has a great influence on the integration of technologies in clinical practice (Allen et al.,

2000). The effectiveness of interventions aimed at the integration of IS/IT applications in the practices of health professionals tends to be influenced by several factors, which are related to individuals, professional groups, organizational and contextual characteristics, and the nature of the intervention per se (Grol et al., 2007; Aarts et al., 2004). One of the most critical factors recognized by the academic literature is resistance to change by healthcare professionals, particularly amongst doctors (Lapointe & Rivard, 2006; Phansalker et al., 2008).

The complexity of systems, together with organizational diversity and the volume of investment required, as well as failure in adopting IS/IT, is all largely justified by the way that IS/IT is implemented, and by the need to identify best practices and to act on a number of critical factors, in order to reduce the chance of failure (Olson & Zhao, 2007). Cooke-Davis & Arzymanow (2003) identify organizational culture as exerting a positive influence on the development of superior project management practices.

FUTURE RESEARCH DIRECTIONS

Healthcare organizations require interdisciplinary cooperation and coordination. It needs to be highlighted that insufficient communication and missing information are among the major issues that have contributed to unintentional injury caused by medical mismanagement (Lenz & Reichert, 2007).

IS/IT processes have the potential to significantly reduce the rate of these adverse events by providing relevant information in real time to all who need it (McDonald et al., 1984). An important challenge for the future is to seek for a *real clinical integration* of systems. Clinical integration between providers and hospitals has historically been a goal which is continually sought, but rarely achieved. It will become crucial that the design of future applications be integrated easier into existing systems, through open communication interface (Geissbuhler et al., 2001).

The *intersection of healthcare and social media* represents another promising field of IS/IT research. Anderson and Agarwal (2010) demonstrate that individuals are more willing to share personal healthcare information if they think that it could help others. Social media platforms could provide aggregation through the mechanisms of information filtering and knowledge synthesis (Kane et al, 2009).

Evidence-based medicine (EBM) is a form of medicine which aims to optimize decision-making by emphasizing the use of evidence from well-designed and well-conducted research. EBM produces quantitative research, especially from randomized controlled trials (RCTs). A randomized controlled trial (Chalmers et al., 1981) is a type of scientific experiment whereby those studied are randomly allocated one or other of the different treatments under study. EBM has been gaining increased attention among researchers (Carey, 2006) as a tool for addressing concerns about healthcare costs and quality.

Another emerging topic for knowledge discovery arises from the use of digital technology to enable new kinds of *mathematical healthcare modelling and simulations* (Lumpkin, 2007). Simulation models are distinguished from other types of conceptual models by the fact that they include simulated objects, such as people, which correspond to real objects, one-to-one. Development of such a model requires creating a population of simulated individuals who all have experienced important events which occur in real life with real people, and who respond to interventions in the same way as real people (Schlessinger & Eddy, 2002).

Another research trend concerns the use of the combined knowledge about a person for predicting treatment response and this can thereby improve that person's health (Redekop & Mladsi, 2013). This concept of *personalized medicine* allows for an earlier and more precise diagnosis, cheaper and

more effective treatments, and the minimization of side effects of treatment (Glaser et al. 2008). Personalized medicine uses genomic medicine to take advantage of a molecular understanding of disease, in order to optimize preventive health care strategies and drug therapies whilst people are still well, or at the earliest stages of disease (Ginsburg & Willard, 2009). Another term which has emerged in recent years is *personalized healthcare*, which extends the previous concept to address questions related to treatment monitoring and disease surveillance.

CONCLUSION

Although project management emerges as being one of the main approaches used by organizations, there is no strong evidence in the literature of the success of the implementation of any of the available approaches in the health sector. This study attempts to show that organizational maturity contributes to the success of a project, through the systematic application of project management best practices.

The combination of the project management and the organizational process maturity approaches provides a more efficient and useful framework for supporting decision-making. The approach proposed in this study tries to prove that it is easier to implement best practices in project management in organizations which have higher levels of organizational maturity, and that the correct combination between investments in IS/IT and management practices can also be a positive influence, leading to successful projects.

We have a strong conviction that higher levels of organizational maturity have a positive influence on the success of projects implemented by organizations particularly in cases where good project management practices are in evidence.

KEY TERMS AND DEFINITIONS

Benefits Management: Benefits Management is an integral part of managing change and aims to increase the success of the measurable and significant benefits of investments in IS/IT for an organization.

Critical Success Factors: Critical success factors are elements which are vital for a project to be successful.

Maturity Models: A theoretical framework that helps organizations to increase their ability to deliver projects by assessing strengths and weaknesses, good sector practices and benchmarking with similar organizations.

Project Management: Project management is the application of processes, methods, knowledge, skills and experience to achieve the project objectives.

Project Management Success: Project management success is measured mostly against cost, time and quality.

Project Success: Project success is measured against the overall objectives of the project.

Project Success Criteria: Project success criteria are the standards by which the project will be judged at completion.

Peer-to-Peer Health-Related Online Support Groups

Neil S. Coulson

University of Nottingham, UK

INTRODUCTION

In recent years more and more individuals living with long-term conditions are turning to the internet for information, advice and support. In particular, there has been a rapid expansion of the number of online support groups (also known as 'online support communities') and this rise in popularity is arguably related to many of the unique characteristics inherent within this form of communication. Researchers have begun to examine the nature of online support groups (e.g., Wright & Bell, 2003), their role in the lives of those living with illness (e.g., Mo & Coulson, 2010) as well as the activities which are taking place online (e.g., Malik & Coulson, 2010). There is much qualitative and cross-sectional evidence (e.g., Coulson, 2005) describing their impact on individuals but as yet there are few well-designed studies which have clearly tested the effects of peer to peer online communication and support. This entry will consider the current state of knowledge with regards key aspects of this growing online phenomenon.

BACKGROUND

Unique Characteristics of Online Support Communities

Online support groups present several unique communication characteristics, which can include anonymity, asynchronous text-based communication and the ability to transcend geographical and temporal barriers (White & Dorman, 2001;

Joinson, 2003; Coulson & Knibb, 2007). These unique characteristics also give rise to a number of unique advantages and disadvantages for individuals choosing to seek support through the medium of online groups.

Potential Advantages

A number of studies (e.g., Ferguson, 1996; Buchanan & Coulson, 2007) have documented the potential advantages of online support groups over more traditional face-to-face sources of support (e.g., face-to-face support groups).

Access Support at Any Time

In contrast to a face-to-face group where members typically meet once a week or less frequently, online groups are available 24 hours a day, 7 days a week (Malik & Coulson, 2008) thereby providing opportunities for peer support at any time of the day or night. As a consequence, this introduces considerable flexibility for individuals in terms of when they wish to access support and this flexibility has been shown to be very helpful for those who have work, family or educational commitments (Coulson & Knibb, 2007).

Asynchronous Communication

The asynchronous nature of many online support groups means that there is no pressure or commitment to engage in real-time communication with other members (Coulson & Knibb, 2007). Instead, members can take their time to read messages and reflect upon their feelings while considering if and

DOI: 10.4018/978-1-5225-2255-3.ch327

how to reply, allowing members to control their level of involvement in a way that is not possible with traditional face-to-face communication (Malik & Coulson, 2008). Indeed, it has been argued that asynchronous communication reduces the pressure associated with real-time communication thereby allowing participants time to carefully construct their messages before contributing to the group (Joinson, 2003).

Anonymity

Online support groups also offer a degree of anonymity that would not be possible in face-to-face communication. This may encourage certain individuals, particularly those patients who feel stigmatised because of their condition, to openly discuss their experiences without fear of a negative reaction.

Group Composition

Since participation in online support groups is not restricted by geographical, physical or spatial barriers, members can potentially access a larger and more heterogeneous mix of people with ease (White & Dorman, 2001). This is likely to be of particular benefit to patients suffering from chronic health conditions, as these individuals, may experience difficulties attending a regular face-to-face meeting due to limitations arising from their condition such as problems with mobility or treatment side effects. The Internet thus offers a novel opportunity for individuals to communicate with similar others in the comfort of their own home.

The ability to reach people from geographically diverse locations also increases the chances of finding others with similar experiences (White & Dorman, 2001). This is particularly helpful for individuals with rare conditions who may be unable to locate people with the same problem in their geographical area. At

the same time, due to their diversity, online support groups are advantageous because they can offer participants a wide variety of different perspectives, viewpoints and experiences on issues related to their condition (Wright, 1999; Wright, 2000). Walther and Boyd (2002) argue that for this reason online communication provides numerous opportunities for people with health concerns to seek support from 'weak tie' relationships. 'Weak ties' refer to relationships between people who might communicate on a regular basis but are not necessarily close. Prior to the advent of the Internet, weak tie networks typically incorporated neighbours, service providers or individuals known through other associations. However, the recent growth in the popularity of the Internet has led to a larger and more heterogeneous pool of individuals that could potentially develop into weak tie networks for people with health concerns.

Granovetter (1982) proposed that since weak ties provide access to a large pool of individuals with a range of different characteristics they are extremely useful sources of information. In addition, since weak tie relationships tend to exist outside of traditional social networks they provide a useful alternative for the discussion of taboo topics, which people may feel reluctant or uncomfortable discussing with their close relations. Online support groups, therefore, can potentially increase the chances of individuals forming weak tie relationships that offer access to diverse sources of information and advice that would not be available from close tie relationships. Furthermore, the absence of visual cues in the online environment and the opportunity to remain entirely anonymous may further facilitate the discussion of taboo or highly sensitive topics. Indeed, a frequently mentioned advantage of health-related online support groups is the perception that members attach less stigma to one's illness, thus removing the fear of being judged negatively (Walther & Boyd, 2001; Wright, 2000).

Adjunct Support

Online support groups can be a useful adjunct to support that is received through face-to-face support groups and other traditional sources (White & Dorman, 2001). There might be occasions when an individual is too ill to attend a face-to-face group, making online support particularly beneficial. Likewise, some individuals might have higher support needs than can be fulfilled by face-to-face groups, and online groups provide a way for them to receive additional support between face-to-face meetings.

Potential Disadvantages

Despite the many potential advantages of peer to peer online support groups, there exists a number of disadvantages (Finfgeld, 2000; White & Dorman, 2001), some of which appear to arise as a result of the computer-mediated nature of the communication.

Absence of Social Cues and Lack of Face-To-Face Contact

Within online support groups social cues including facial expressions, tone of voice or body language are not apparent and this can sometimes present unique challenges to group members (Coulson & Knibb, 2007). As a consequence, it is not uncommon for misunderstandings to arise when members misinterpret what has been posted by others, or feelings of awkwardness when members make incorrect assumptions about other members (Attard & Coulson, 2012). In order to compensate for these limitations, group members may employ emoticons or excessive punctuation in their communications (van Uden-Kraan, Drossaert, Taal, Lebrun et al., 2008a). In addition, the lack of physical proximity may potentially limit the extent to which a meaningful face-to-face relationship can develop between members as well as precluding the ability to offer a hug or touch someone (Coulson, 2013).

Anonymity

The anonymity inherent to the Internet could lead to deindividuation. Deindividuation is described by Festinger, Pepitone, and Newcomb (1952) as a state of lowered self-awareness where a person temporarily loses their individual sense of identity and becomes immersed into the identity of a larger group. Some authors argue that due to this deindividuation Internet behaviour will inevitably be characterised by increased instances of disinhibited communication such as aggressive and hostile exchanges often referred to as flaming.
